Section 1.0

Overview

The purpose of the Knoxville Sidewalk Study is to provide a clear direction for sidewalk infrastructure in the City of Knoxville, ensuring that residents and visitors are able to walk or use a mobility device in a safe and comfortable manner. To this end, the study includes a comprehensive inventory of the existing sidewalk network, an inclusive public and stakeholder outreach and engagement effort, and a deliberate analysis of priorities. The study establishes a framework that can inform sidewalk investment in the city going forward and help the city identify both short- and long-term investment priorities.

The Knox County population is poised to grow by 25 percent by 2050 (University of Tennessee, 2019). With this growth comes the need to invest and reinvest in infrastructure to connect neighborhoods, schools, parks, commercial areas, and employment centers. While some trips are still best accomplished with motor vehicles – personal automobile, transit, or rideshare – shorter trips can be accomplished using active transportation, specifically bicycling or walking.

Recent trends also demonstrate an increased interest in active transportation, including pedestrian facilities. As the Knoxville region continues to grow, providing transportation choices for people of all ages and abilities will become increasingly important. The Knoxville Sidewalk Study provides a framework for meeting the growing demand for safe and comfortable pedestrian facilities. Meeting the growing demand for walking will not only improve conditions for pedestrians but will also enhance the quality of life in neighborhoods, support economic development, and build upon Knoxville's unique assets to reinforce the city's position as the regional hub of East Tennessee.

1.1 Public and Stakeholder Involvement

The Knoxville Sidewalk Study was shaped by a diverse cross section of community residents and key stakeholders. Public meetings were held in each of the city's planning districts and additional input was captured through an online survey and interactive map. The public meetings and online outreach tools were complemented by small group discussions with stakeholders from local government agencies, non-profit organizations, and advocacy groups.

Public Workshops

Six public workshops were held throughout the City of Knoxville over two weeks in June 2019 in each of the city's six planning districts. Workshop locations included:

- Burlington Branch Library;
- Christenberry Recreation Center;
- Cumberland Estates Recreation Center;
- Deane Hill Recreation Center;
- Larry Cox Senior Center; and
- South Doyle Middle School.

The workshops focused on three primary questions:

- What are your priorities for the sidewalk system in Knoxville?
- What type of improvements would you like to see?
- What are specific suggestions for locations that would benefit from a new or improved sidewalk or crosswalk?

Attendees were asked to answer the first question by reviewing potential study goals and ranking them on a scale of one to five, with one the most important and five the least important. Table 1-1 reports the composite results from all the workshops. Attendees ranked constructing new sidewalks and crosswalks in areas without pedestrian facilities as the most important overall goal, with improving existing sidewalks and crosswalks that are in poor condition and prioritizing connections to public transit as the next highest priorities.

Table 1-1. Study Priorities

Goals/Ranking	1	2	3	4	5	Weighted Average
Construct new sidewalks and crosswalks in areas without pedestrian facilities	28	9	8	8	11	1.84
Improve existing sidewalks and crosswalks that are in poor condition	12	9	9	8	16	2.04
Prioritize pedestrian connections to public transit and places where people work	17	12	7	10	11	2.07
Focus on filling gaps between existing sidewalks including crosswalks	16	16	13	8	8	2.16
Expand pedestrian connections to schools, parks, and other public facilities	15	13	13	13	4	2.43

The second question focused on the types of facilities, design features, and amenities attendees would like to see included in the sidewalk network. Table 1-2 summarizes the results from the workshops. The most popular walkway identified was a sidepath for walking and biking with separated space for pedestrians and bicyclists. Sidewalks with narrow buffers were the least preferred walkway. Attendees identified crossing islands as the most desirable crosswalk element, followed closely by intersection crosswalks, suggesting a preference for an improved level of comfort at intersections. With respect to streetscape elements, transit shelters were the most preferred element of all presented, followed closely by pedestrian lighting.

Table 1-2. Preferred Improvement Options

	Improvement	Total	Percentage
Walkways	Sidepaths for Walking and Biking with Separation	29	11%
	Sidewalks with Wide Buffers	24	9%
	Sidepaths for Walking and Biking	23	8%
	Sidewalks with Narrow Buffers	12	4%
Crosswalks	Crossing Islands	27	10%
	Intersection Crosswalks	25	9%
	Mid-Block Crosswalks	15	6%
	Curb Extensions	14	5%
Streetscapes	Transit Shelters	36	13%
	Pedestrian Lighting	32	12%
	Street Trees	20	7%
	Street Furniture	14	5%

Attendees were also invited to review aerial plots of each of the city's six planning districts and identify locations that would benefit from a new or improved sidewalk or crosswalk. The feedback received was ultimately carried forward into the pedestrian network plan, which is discussed in Section 4.0.

Stakeholder Engagement

A series of stakeholder meetings was convened in July 2019. Attendees represented local government agencies, non-profit organizations, and advocacy groups. They were provided with a brief update of the public engagement and technical analysis conducted to date and encouraged to provide comments or suggestions on the study. Stakeholder feedback was used to refine the study approach, specifically the scope of the pedestrian system analysis, which is discussed in Section 3.0.

Online Survey

An online survey was hosted on the SurveyMonkey platform. The survey period ran from June through October. A total of 317 respondents participated during this time. Tables 1-3 through 1-8 summarize some of the key feedback from the survey.

Table 1-3. What do you consider to be your primary form of transportation?

Answer Choices	Total	Percentage
Automobile	287	92.6%
Transit	5	1.6%
Rideshare/Carpool	1	0.3%
Bicycle	7	2.3%
Walking	10	3.2%

Table 1-4. How often do you use sidewalks?

Answer Choices	Total	Percentage
Daily	126	40.6%
Weekly	96	31.0%
Rarely/Never	59	19.0%
Monthly	29	9.4%

Table 1-5. What are your primary uses of sidewalks?

Answer Choices	Total	Percentage
Exercise	217	32.0%
Recreation	150	22.1%
Transportation	137	20.2%
Walking pet(s)	137	20.2%
Other	37	5.5%

Table 1-6. Which destination(s) do you use a sidewalk to access?

Answer Choices	Total	Percentage
Neighbors/friends/family	183	19.4%
Park or recreational facility	170	18.0%
Commercial districts with shopping/restaurants	134	14.2%
Elementary school	89	9.4%
Grocery store	85	9.0%
Work	63	6.7%
Transit service	44	4.7%
Middle school	43	4.6%
Church	41	4.3%
College or university	28	3.0%
Other	27	2.9%
High school	23	2.4%
Hospital or medical services	15	1.6%

Table 1-7. What barriers have prevented you from walking in the past?

Answer Choices	Total	Percentage
Lack of adequate sidewalks	267	36.5%
Personal safety concerns	133	18.2%
Poor condition of existing facilities	81	11.1%
Weather	72	9.8%
Accompanied by children	59	8.1%
Need to carry or haul things	46	6.3%
Other	25	3.4%
Don't have time	21	2.9%
Physically unable	14	1.9%
Don't think about walking	14	1.9%

Table 1-8. How would you prioritize pedestrian access to the following locations?

Answer Choices	1	2	3	4	5	6	7	8	9	10	Weighted Average
Elementary school	0	0	0	0	0	0	14	32	72	330	9.60
Middle school	0	0	0	0	0	12	7	56	54	310	9.46
High school	0	0	0	0	5	24	14	64	54	260	9.18
Transit service	0	0	3	0	5	18	21	104	27	220	8.95
Grocery store	0	0	0	4	30	6	42	48	27	210	8.78
College or university	0	0	0	8	25	12	35	56	36	210	8.76
Hospital or medical services	0	0	3	4	40	12	7	56	36	190	8.67
Neighbors/Friends/Family	1	0	0	0	10	42	49	64	36	160	8.51
Work	0	0	0	0	45	18	21	64	27	170	8.51
Commercial districts with shopping/restaurants	0	0	0	0	40	18	49	64	45	140	8.34
Church	0	2	0	12	45	12	35	56	9	140	8.11

Online Interactive Map

In addition to the survey, an online interactive map was hosted on the Wikimapping platform. Like the public workshop mapping exercise, participants were asked to identify locations where new or improved sidewalks or crosswalks are needed. Comments were carried forward into the network plan in Section 4.0.

1.2 Goals and Objectives

Based on input received at the public workshops – as well as guidance from local officials and stakeholders – the following goals and objectives were identified to guide the development of the Knoxville Sidewalk Study.

Goal 1: Construct new sidewalks and crosswalks in areas without pedestrian facilities

- Expand the sidewalk network into areas with the highest demand for walking and areas with vulnerable populations (e.g., older adults, people with disabilities, low income households, which are defined in greater detail in Section 3.0) who would most benefit from an improved pedestrian environment

Goal 2: Improve existing sidewalks and crosswalks that are in poor condition

- Prioritize existing facilities in poor condition for targeted rehabilitative maintenance

Goal 3: Prioritize pedestrian connections to public transit and places where people work

- Coordinate with Knox Area Transit (KAT) to determine high priority locations for pedestrian facilities near transit services
- Connect to major employment centers, particularly those without existing pedestrian facilities

Goal 4: Focus on filling gaps between existing sidewalks, including crosswalks

- Identify “network gaps” in the existing network for new facilities, prioritizing shorter “network gaps”
- Focus on key intersections where pedestrian safety would be most improved by the addition or improvement of a crosswalk

Goal 5: Expand pedestrian connections to schools, parks, and other public facilities

- Evaluate and improve the pedestrian environments around school facilities, particularly the Parental Responsibility Zones (PRZs) associated with elementary and middle schools
- Improve connectivity to parks and public facilities

Section 2.0

Existing Network

2.1 Existing Sidewalk System

The City of Knoxville currently has approximately 345 miles of existing sidewalks. Table 2-1 shows the breakdown of total network miles by city council district. The majority of the existing network is located within Council District 6, which includes downtown Knoxville and all of east Knoxville. Council District 1, which includes the University of Tennessee area and south Knoxville, and Council District 4, which encompasses the northeast portion of the city, also have relatively large shares of the existing network mileage. Figure 2-1 shows a graphical representation of the existing network by city council district.

Table 2-1. Existing Network Miles by City Council District

Council District	Miles of Sidewalks	Percentage of Total Network
1	52	15%
2	29	8%
3	31	9%
4	60	17%
5	39	11%
6	134	39%
TOTAL	345	100%

2.3 Existing Approach to Sidewalk Investment

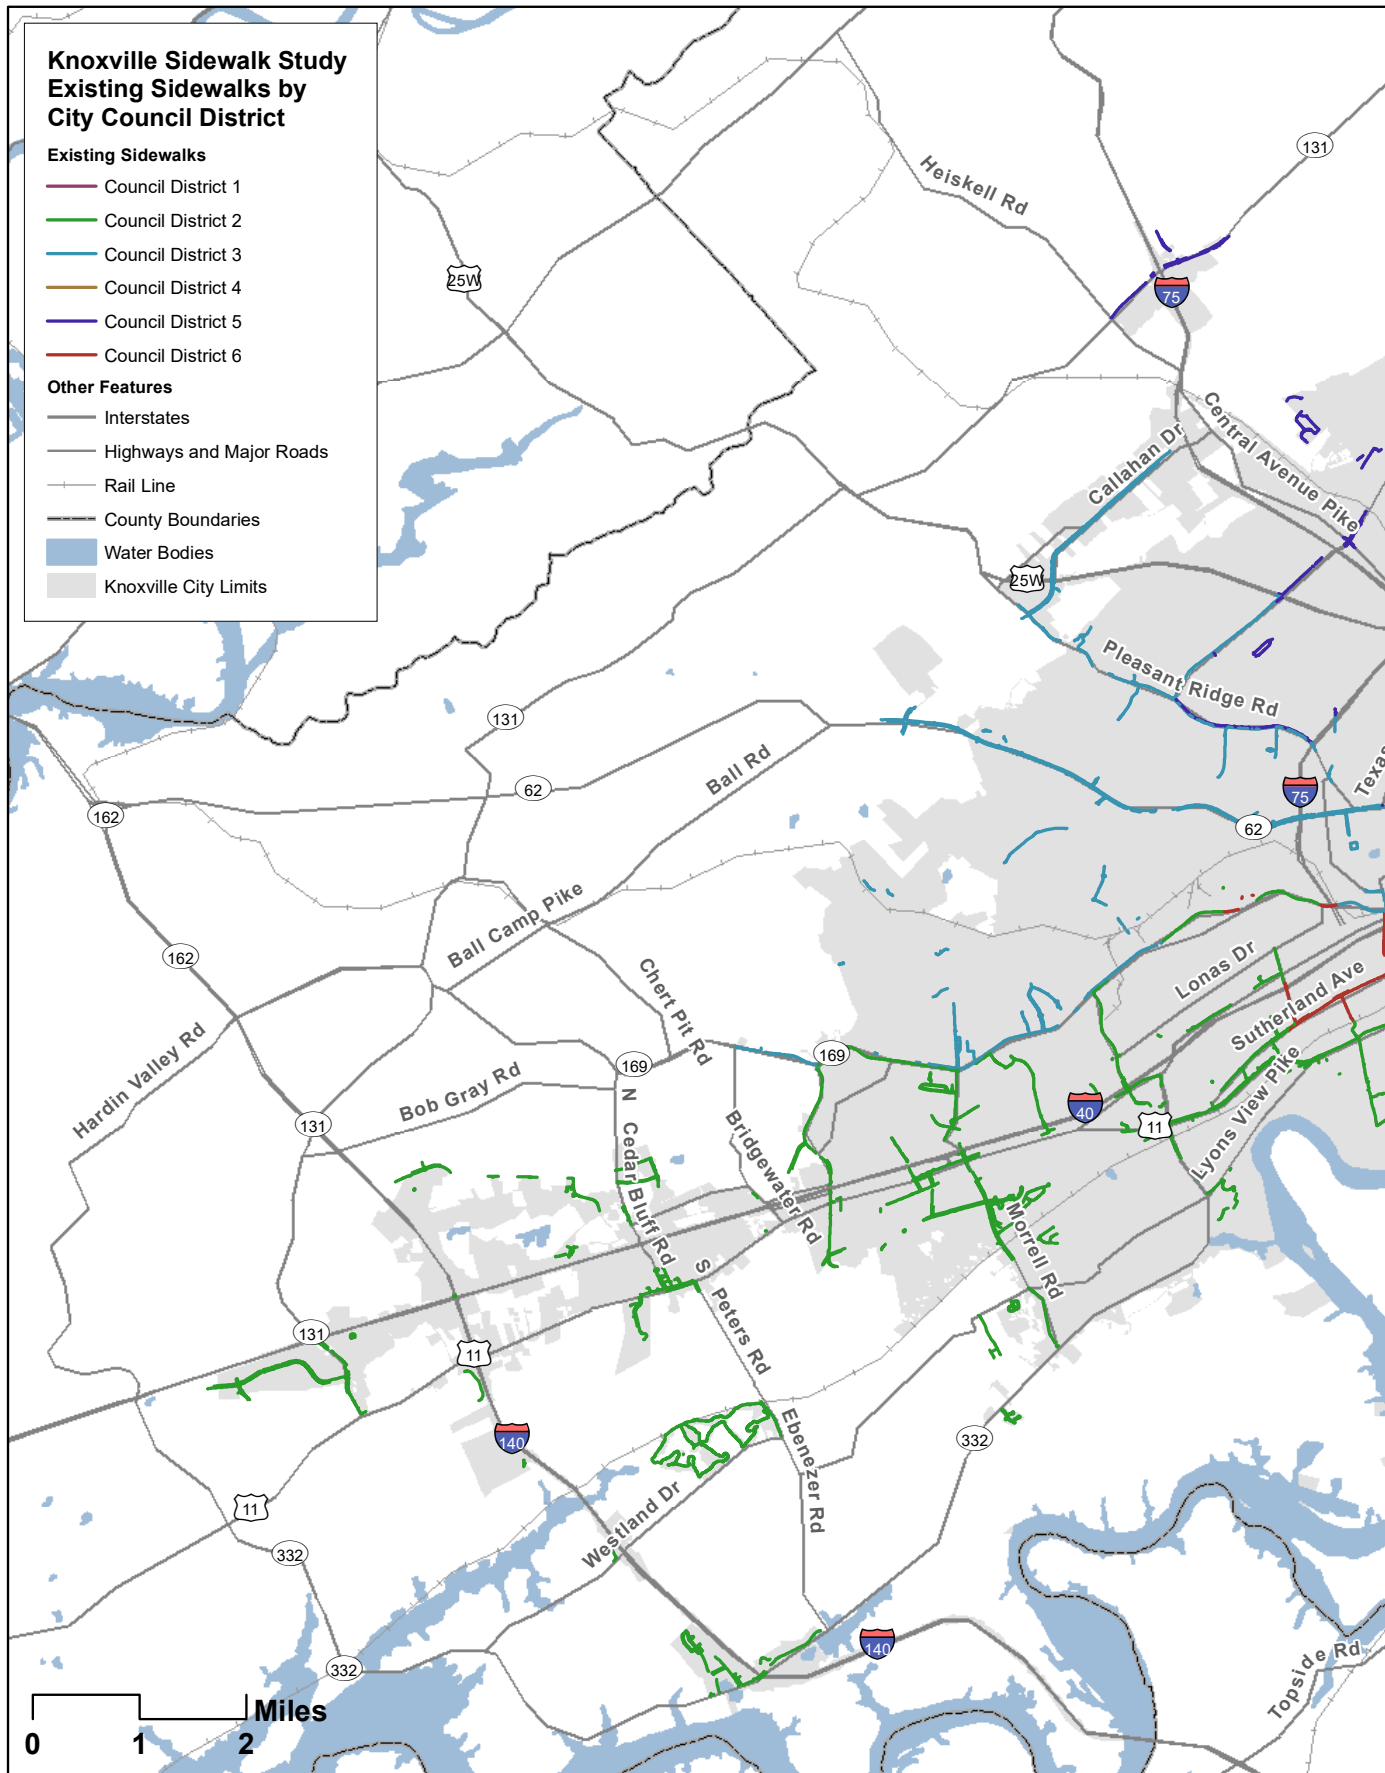

A primary outcome of the Knoxville Sidewalk Study is to identify and prioritize sidewalk needs within the city going forward. The study recommendations and priorities will supersede the existing manner of identifying and prioritizing sidewalk facility needs. Currently the City of Knoxville identifies new sidewalk facility needs primarily based on requests received from the public. Community groups, neighborhood associations, or individual members of the public currently may contact the Civil Engineering Division directly to request a new sidewalk.

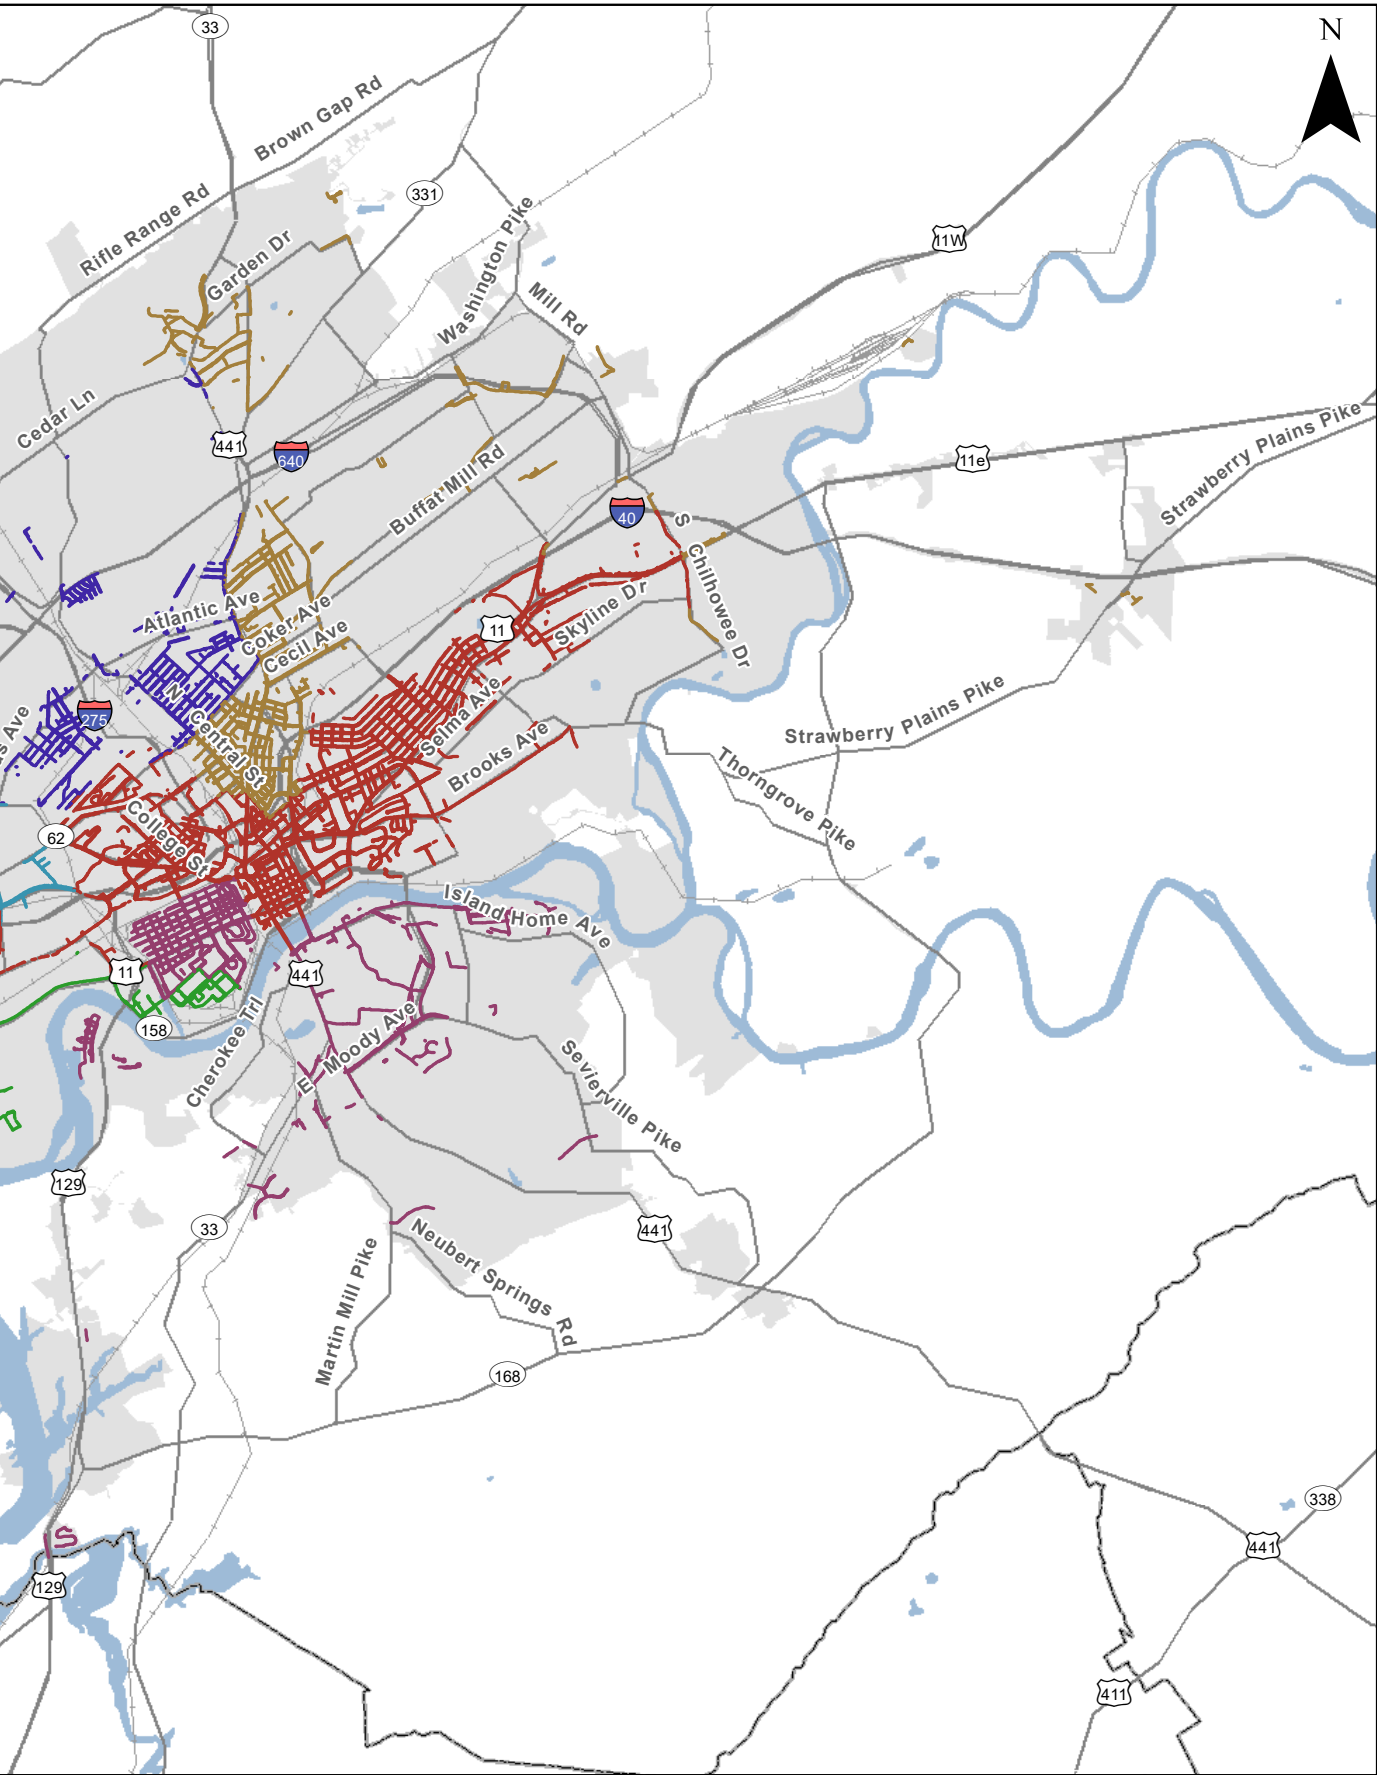

Sidewalk requests are scored by using the Sidewalk Request Rating System, which allows city staff to investigate and rank each request received. Based on the investigation, each sidewalk request is scored using the following five criteria:

- Pedestrian use;
- Roadway classification;
- Proximity to an existing sidewalk;
- Inclusion within a school's Parental Responsibility Zone (within approximately one mile of a school); and
- Connectivity to Knox Area Transit Routes.

In the future, sidewalk requests will continue to be evaluated by city staff as they are received; however, the Knoxville Sidewalk Study will replace the Sidewalk Request Rating System as the primary source of city sidewalk investments.

Figure 2-1. Existing Sidewalk Network

Section 3.0

Pedestrian System Analysis

As part of the Knoxville Sidewalk Study, a pedestrian system analysis was conducted to provide a comprehensive view of the existing sidewalk network. The results of the analysis form the basis for the pedestrian network plan recommendations. The pedestrian system analysis consists of four primary components:

- Pedestrian Demand Analysis;
- Pedestrian Safety Analysis;
- Health and Equity Analysis; and
- Sidewalk “Network Gap” Analysis.

Taken together, the findings from these analyses provide a clearer understanding of the existing pedestrian environment, potential benefits for users, and key areas for sidewalk expansion.

3.1 Pedestrian Demand Analysis

A desktop analysis was conducted to identify potential pedestrian demand in the City of Knoxville. The pedestrian demand analysis determines where current pedestrian demand likely exists regardless of the presence or absence of existing facilities; in other words, where users would likely walk, provided they felt comfortable doing so.

The analysis relies on nine inputs to generate a composite demand score:

- Population density;
- Employment density;
- Existing park facilities;
- Total retail, arts, entertainment, recreation, accommodations, and food services employment;
- Existing elementary and middle schools;
- Existing secondary and post-secondary schools;
- Existing Knox Area Transit (KAT) routes;
- Existing libraries; and
- Existing hospitals.

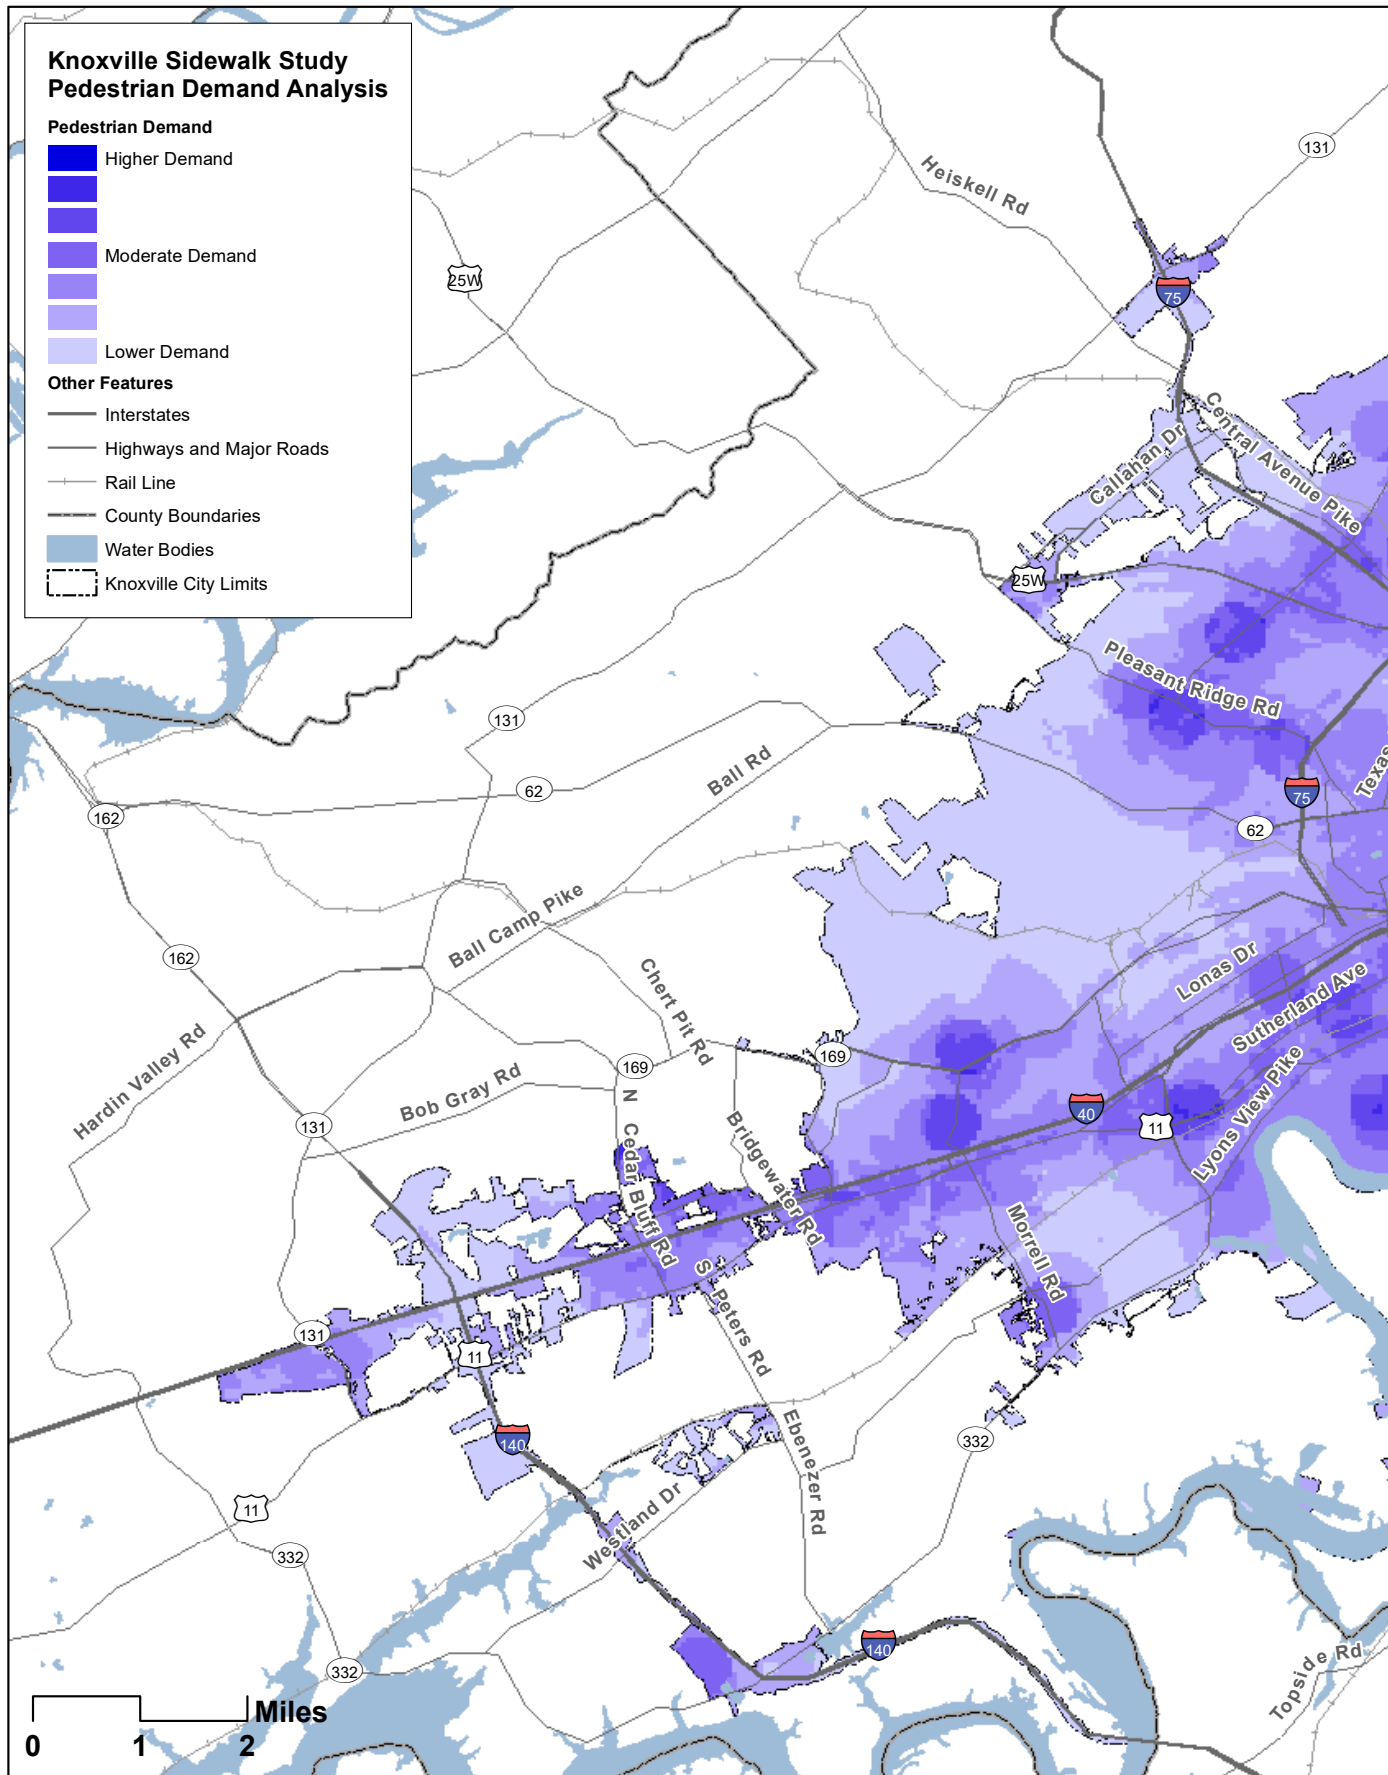

Using feedback obtained during the public and stakeholder engagement activities, each of the demand inputs was weighted to reflect higher community priorities (Table 3-1). A final demand score was calculated by assigning values to each category, multiplying the values by their respective weights, and totaling the weighted scores together. The final composite score was then normalized to a 0 to 100 point scale for later use in the prioritization process.

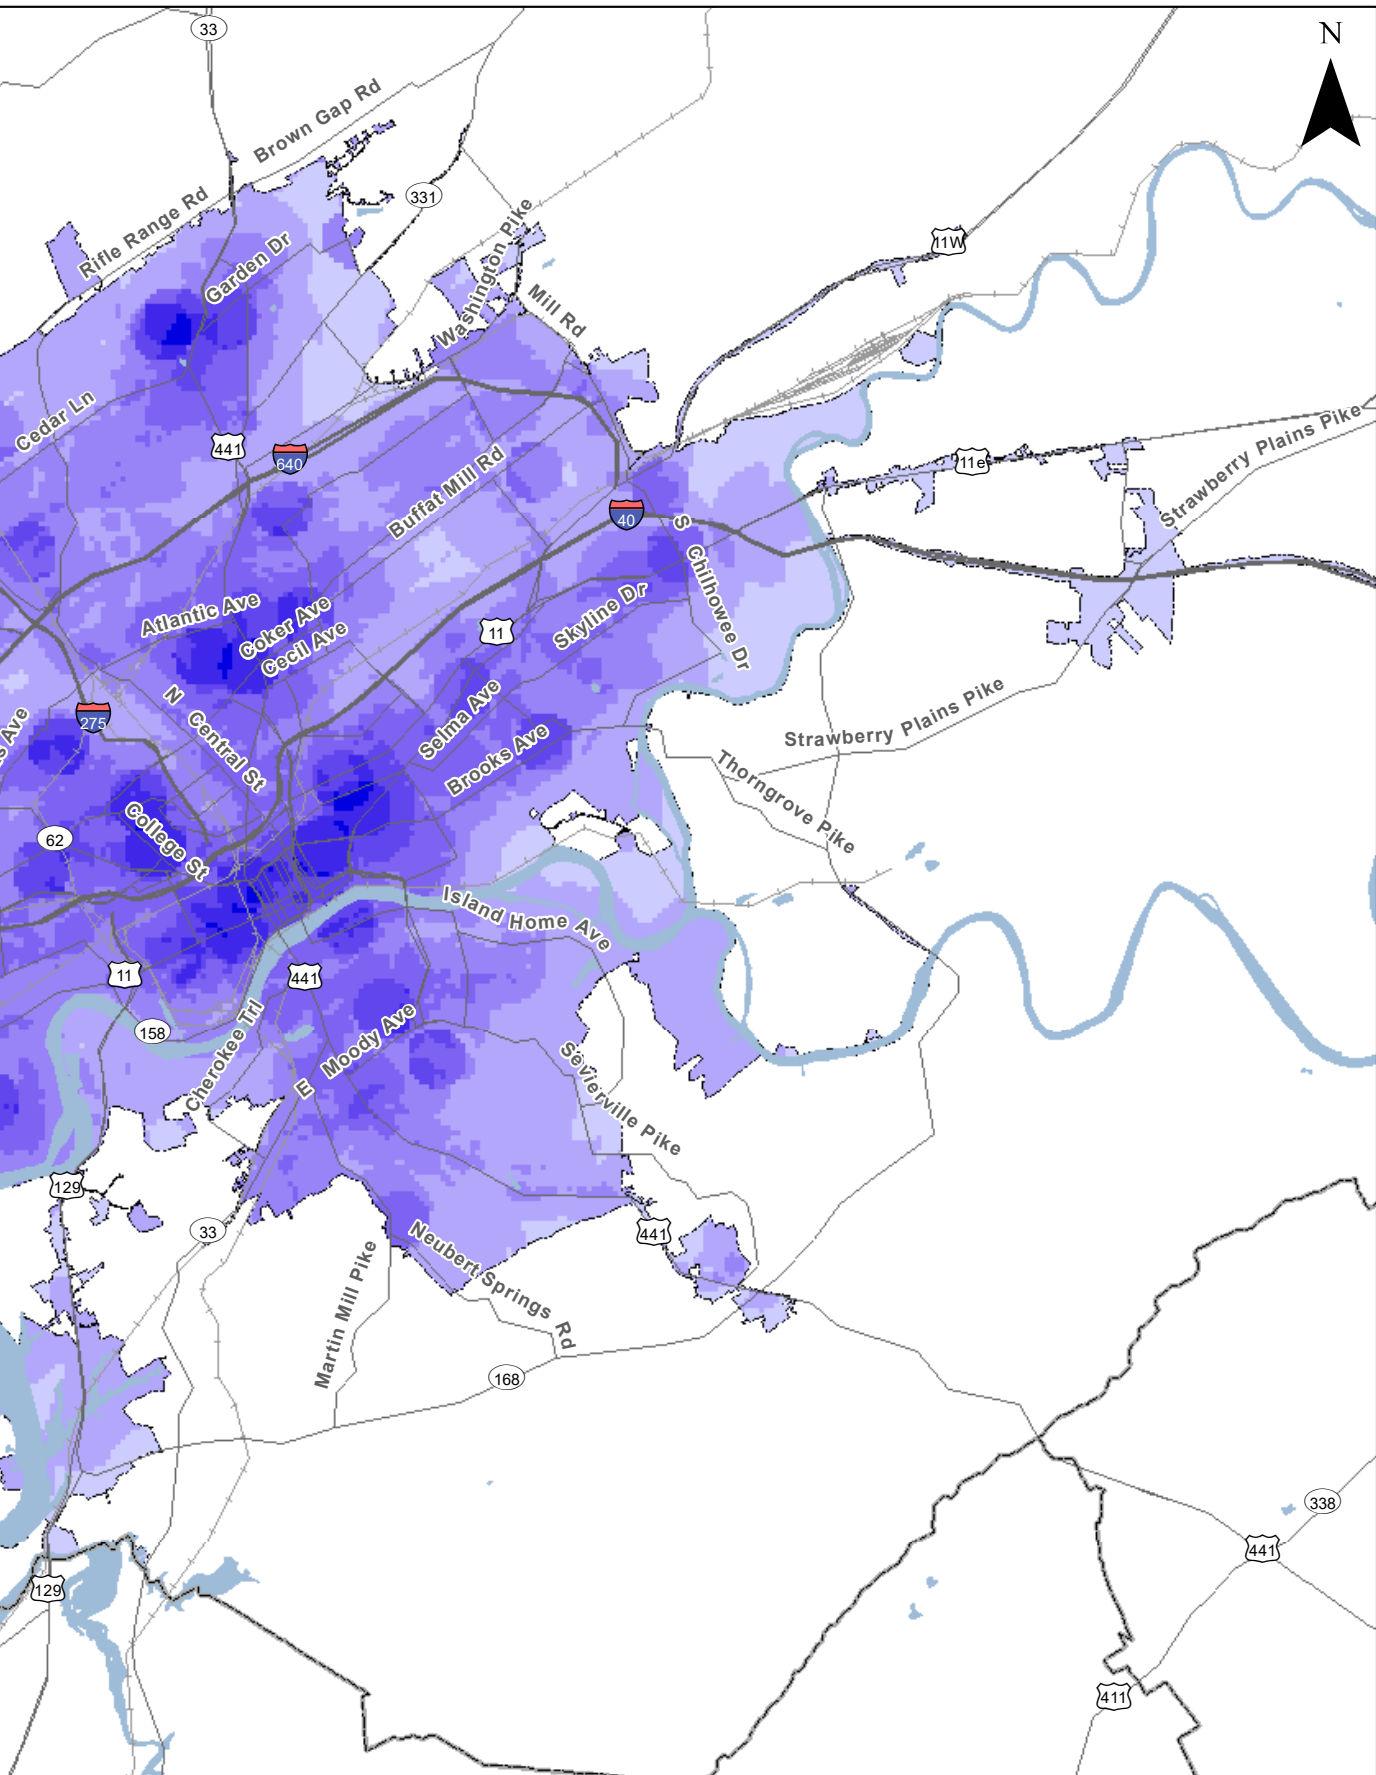

The results of the demand analysis are shown in Figure 3-1.

Table 3-1. Pedestrian Demand Analysis Criteria

Data Input	Source	Scoring	Weighting
Population Density	2017 ACS 5-Year Estimates (Block Groups)	0 - Less than 3.5 persons per acre	3.0
		1 - 3.5 to 7 persons per acre	
		2 - 7 to 12 persons per acre	
		3 - Greater than 12 persons per acre	
Employment Density	2016 Longitudinal Employer-Household Dynamic (LEHD), Work Area Characteristics (Blocks)	0 - Less than 15 jobs per acre	1.0
		1 - 15 to 50 jobs per acre	
		2 - 50 to 100 jobs per acre	
		3 - Greater than 100 jobs per acre	
Existing Park Facilities	KGIS	0 - Further than 1 mile from a park	4.5
		1 - 0.5 to 1 mile from a park	
		2 - 0.25 to 0.5 mile from a park	
		3 - Less than 0.25 mile from a park	
Retail, arts, entertainment, recreation, accommodations, and food services employment	2016 Longitudinal Employer-Household Dynamic (LEHD), Work Area Characteristics (Blocks)	0 - Less than 100 employees	3.0
		1 - 100 to 250 employees	
		2 - 250 to 500 employees	
		3 - Greater than 500 employees	
Existing Elementary and Middle Schools	KGIS	0 - Further than 1 mile from a school	5.0
		1 - 0.5 to 1 mile from a school	
		2 - 0.25 to 0.5 mile from a school	
		3 - Less than 0.25 mile from a school	
Existing Secondary and Post-Secondary Schools	KGIS	0 - Further than 1 mile from a school	4.0
		1 - 0.5 to 1 mile from a school	
		2 - 0.25 to 0.5 mile from a school	
		3 - Less than 0.25 mile from a school	
Knoxville Area Transit System Existing Routes	KGIS	0 - Further than 0.5 mile from a transit route	4.0
		1 - 0.5 to 0.25 mile from a transit route	
		2 - 0.25 to 0.1 mile from a transit route	
		3 - Adjacent to a transit route	
Existing Libraries	KGIS	0 - Further than 1 mile from a library	3.0
		1 - 0.5 to 1 mile from a library	
		2 - 0.25 to 0.5 mile from a library	
		3 - Less than 0.25 mile from a library	
Existing Hospitals	KGIS	0 - Further than 1 mile from a hospital	1.0
		1 - 0.5 to 1 mile from a hospital	
		2 - 0.25 to 0.5 mile from a hospital	
		3 - Less than 0.25 mile from a hospital	

Figure 3-1. Pedestrian Demand Analysis Results

At the citywide scale, five areas received notably higher composite demand scores:

- Downtown Knoxville and University of Tennessee campus;
- East Knoxville near the Morningside and Parkridge neighborhoods;
- Mechanicsville and Lonsdale neighborhoods;
- Christenberry neighborhood in North Knoxville; and
- Fountain City.

Additional areas of relatively high demand are located throughout the city and its neighborhoods, particularly around school campuses. Given the high priority identified by the public for expanding the sidewalk network into areas without existing pedestrian facilities, new sidewalks will be important additions in places with higher demand.

3.2 Pedestrian Safety Analysis

The pedestrian safety analysis was performed using data provided by the Knoxville Regional Transportation Planning Organization (TPO). The data is comprised of 11 years of crash report data collected and reported by the Knoxville Police Department (KPD). The analysis related the crash locations to an existing sidewalk segment, intersection, or segment of roadway currently lacking sidewalks. For the purpose of this study, a pedestrian crash is defined as a vehicular crash involving one or more pedestrians occurring within the public right-of-way (e.g., excluding parking lots and private property).

Pedestrian Crashes

The analysis was based on pedestrian crash reports collected between January 2007 and March 2018. The reports identified a total of 960 crashes that involved pedestrians within the City of Knoxville during the subject time period. As shown in Figure 3-2, over this period, the annual number of pedestrian-involved crashes has varied, but has averaged approximately 85 crashes per year.

Figure 3-2. Knoxville: Annual Pedestrian Crashes (2007-2017)

Crash Severity

Crash reports classify the severity of crashes as fatal, suspected serious/incapacitating injury, suspected minor injury, possible injury, or no injury. The crash data demonstrates that 91 percent of pedestrian crashes within the City of Knoxville involved some level of injury or death for the involved pedestrian(s). A more in-depth analysis of crash data between January 2015 and March 2018 found that 21 percent of injury-only crashes involved serious/incapacitating injuries. Over the 11-year period, there have been a total of 36 pedestrian fatalities in the City of Knoxville.

Crash Hotspots

A review of the crash data revealed several crash hotspots within the city. A heat map was developed to highlight these areas. As shown in Figure 3-3, while smaller “heat islands” of crash density are located throughout the city, particularly along urban arterials or near major intersections, four areas in the city have high concentrations of crashes:

- University of Tennessee area, particularly on or adjacent to Cumberland Avenue;
- Downtown Knoxville and the Old City;
- West View area near the intersection of Middlebrook Pike and Liberty Street; and
- North Broadway between Washington Pike and Cecil Avenue.

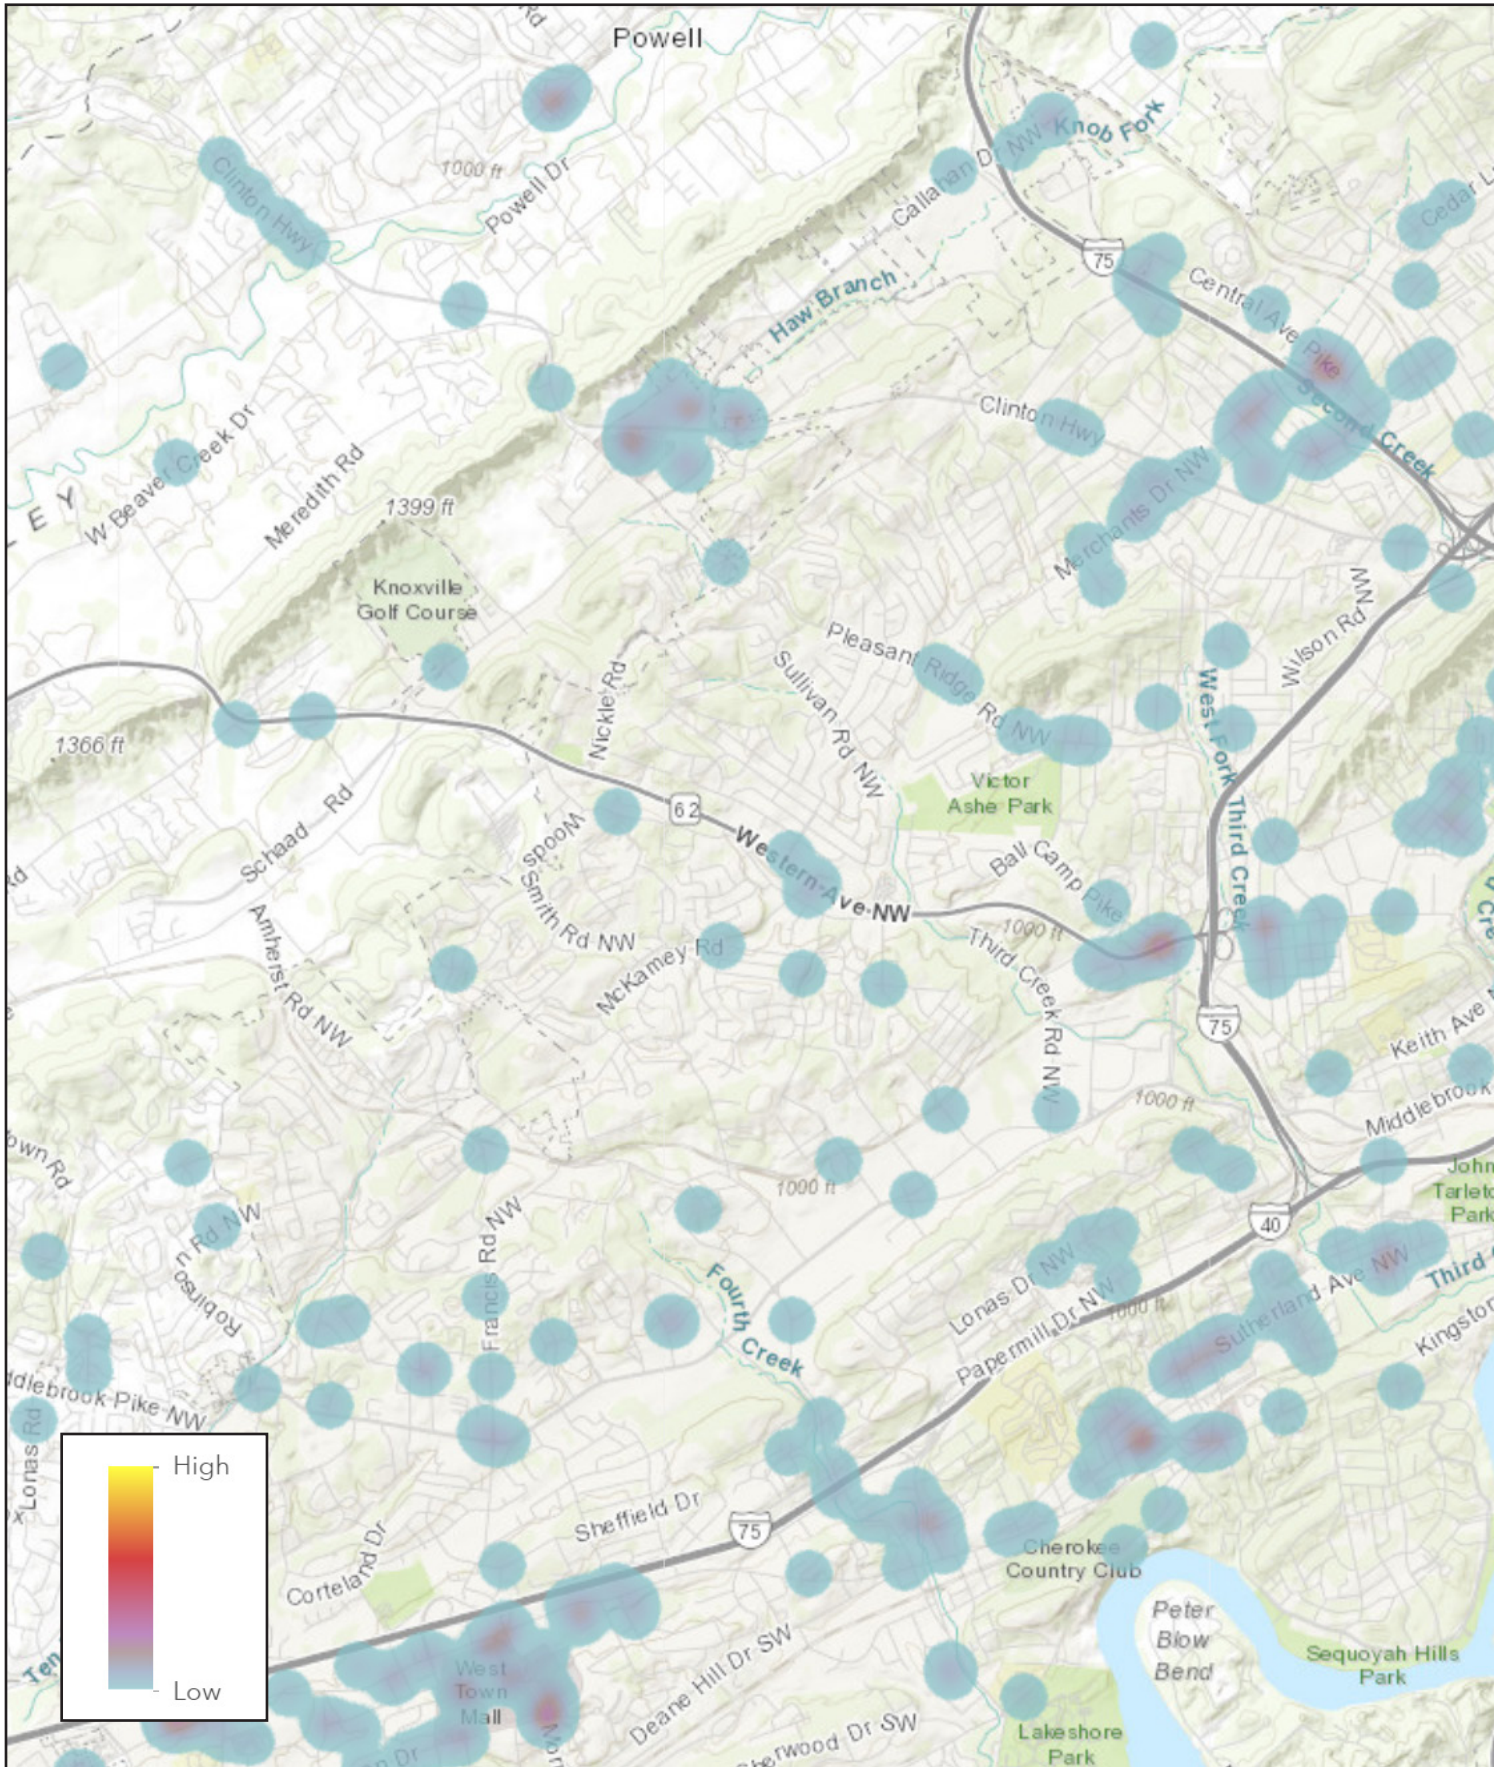

Cumberland Avenue recently underwent a reconfiguration to better accommodate pedestrian foot traffic. These improvements have resolved many of the pedestrian safety issues along the corridor.

Interestingly, only one specific location lacking sidewalks had repeat crashes reported – two crashes occurred at West Inskip Drive near Schubert Road. However, along the 0.6-mile corridor of Inskip Drive between Fennell Road and Schubert Road there were a total of five crashes.

Pedestrian Safety Segment Index

A review of the crash data also highlighted that the majority of crashes occurred on streets defined by the 2018 Knoxville-Knox County Major Road Plan as urban collectors or urban arterials. The high rate of pedestrian crashes along collectors and arterials occurs for several reasons. Higher motor vehicle speeds and volumes associated with these roadways, for example, result in reduced reaction times and increased conflict points among drivers and pedestrians. Additionally, many collectors and arterials serve areas of town with higher levels of pedestrian activity.

Figure 3-3. Crash Hotspots

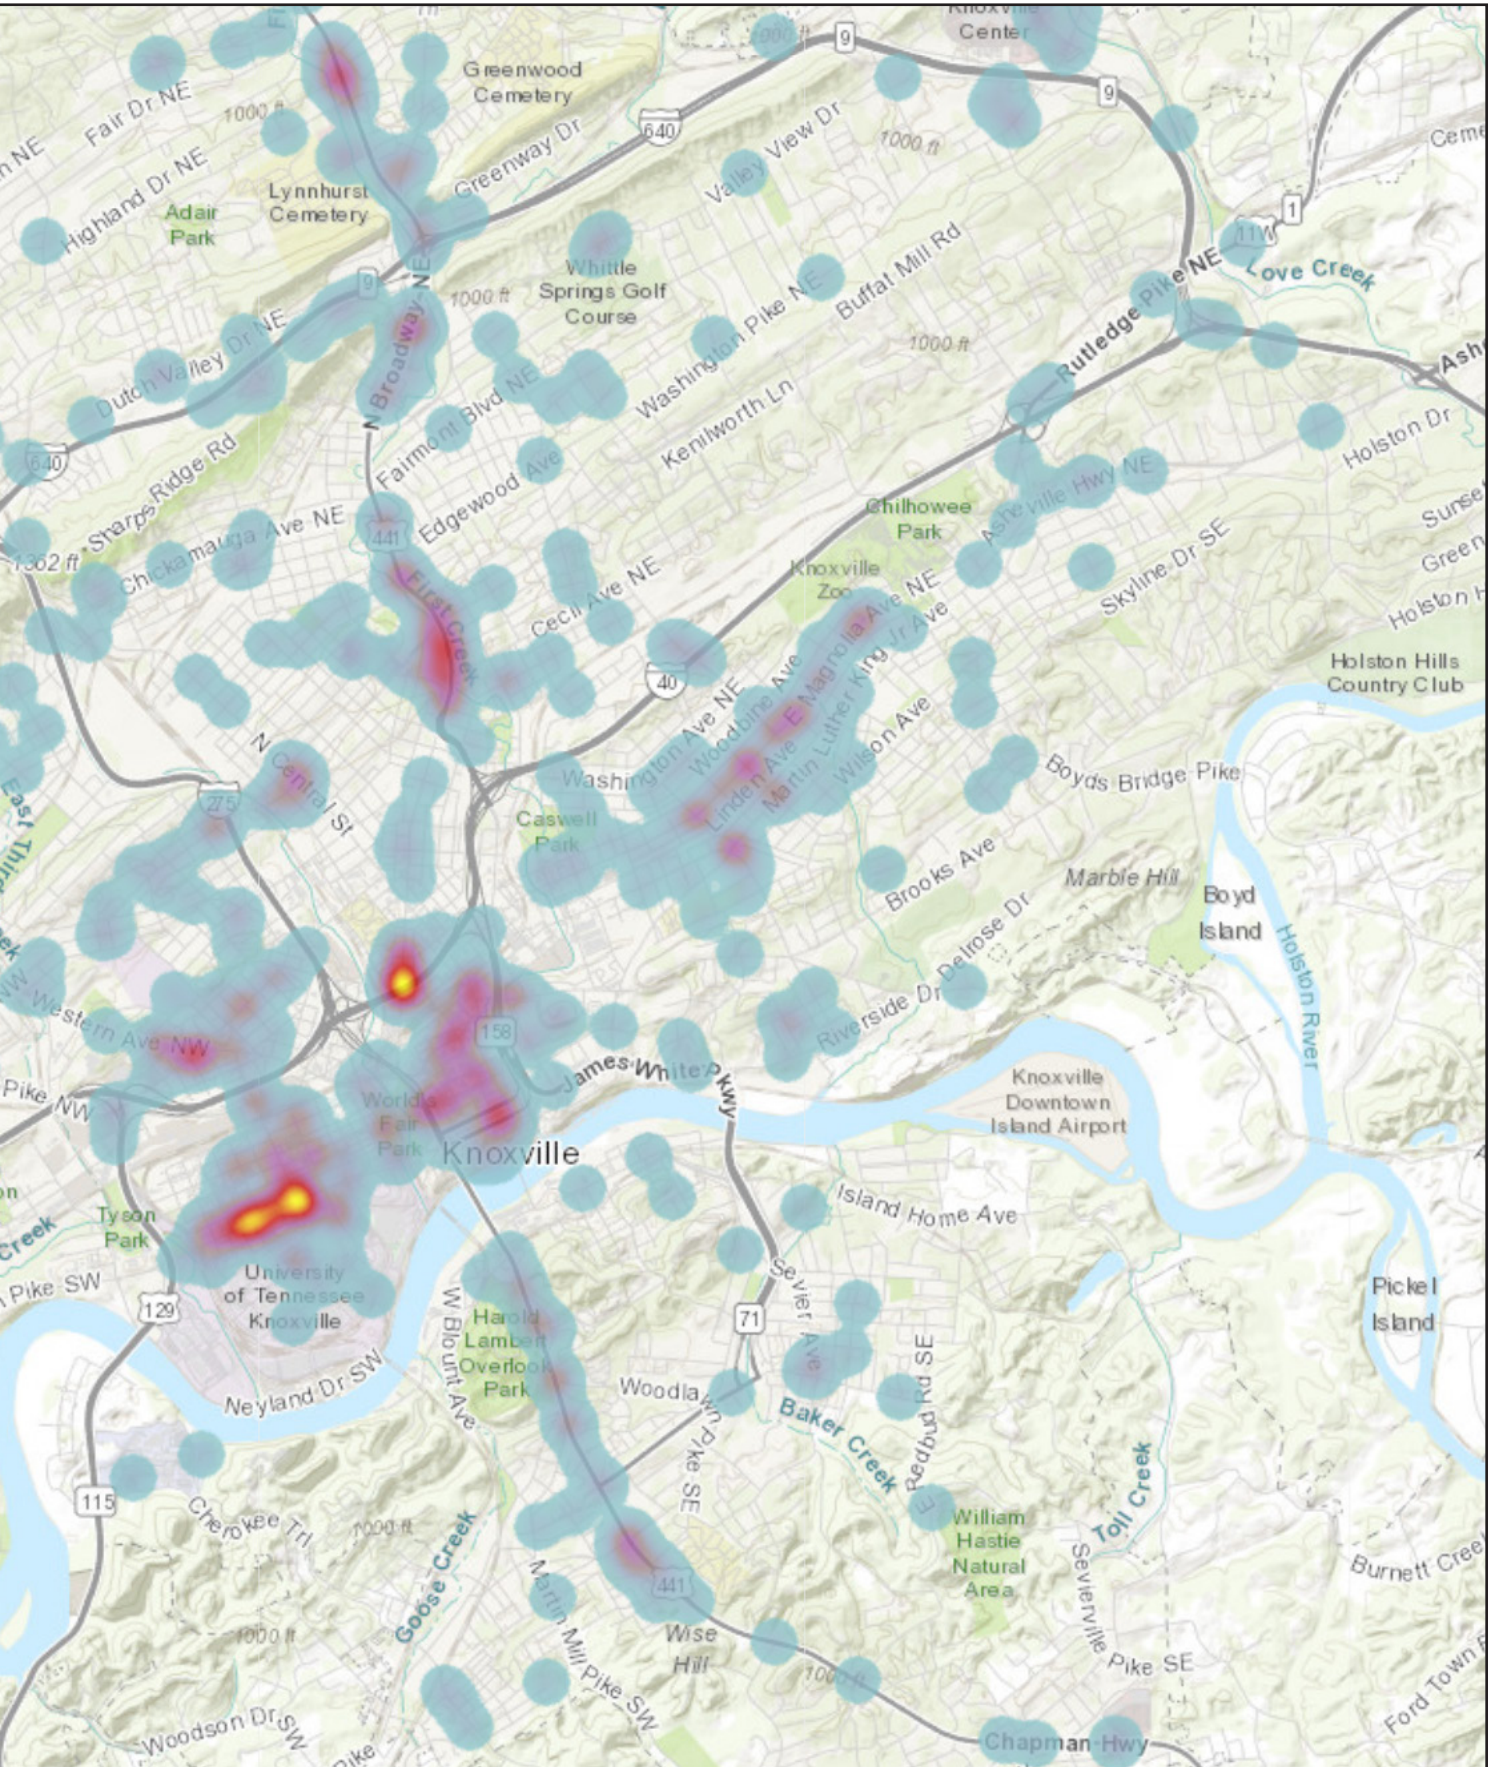

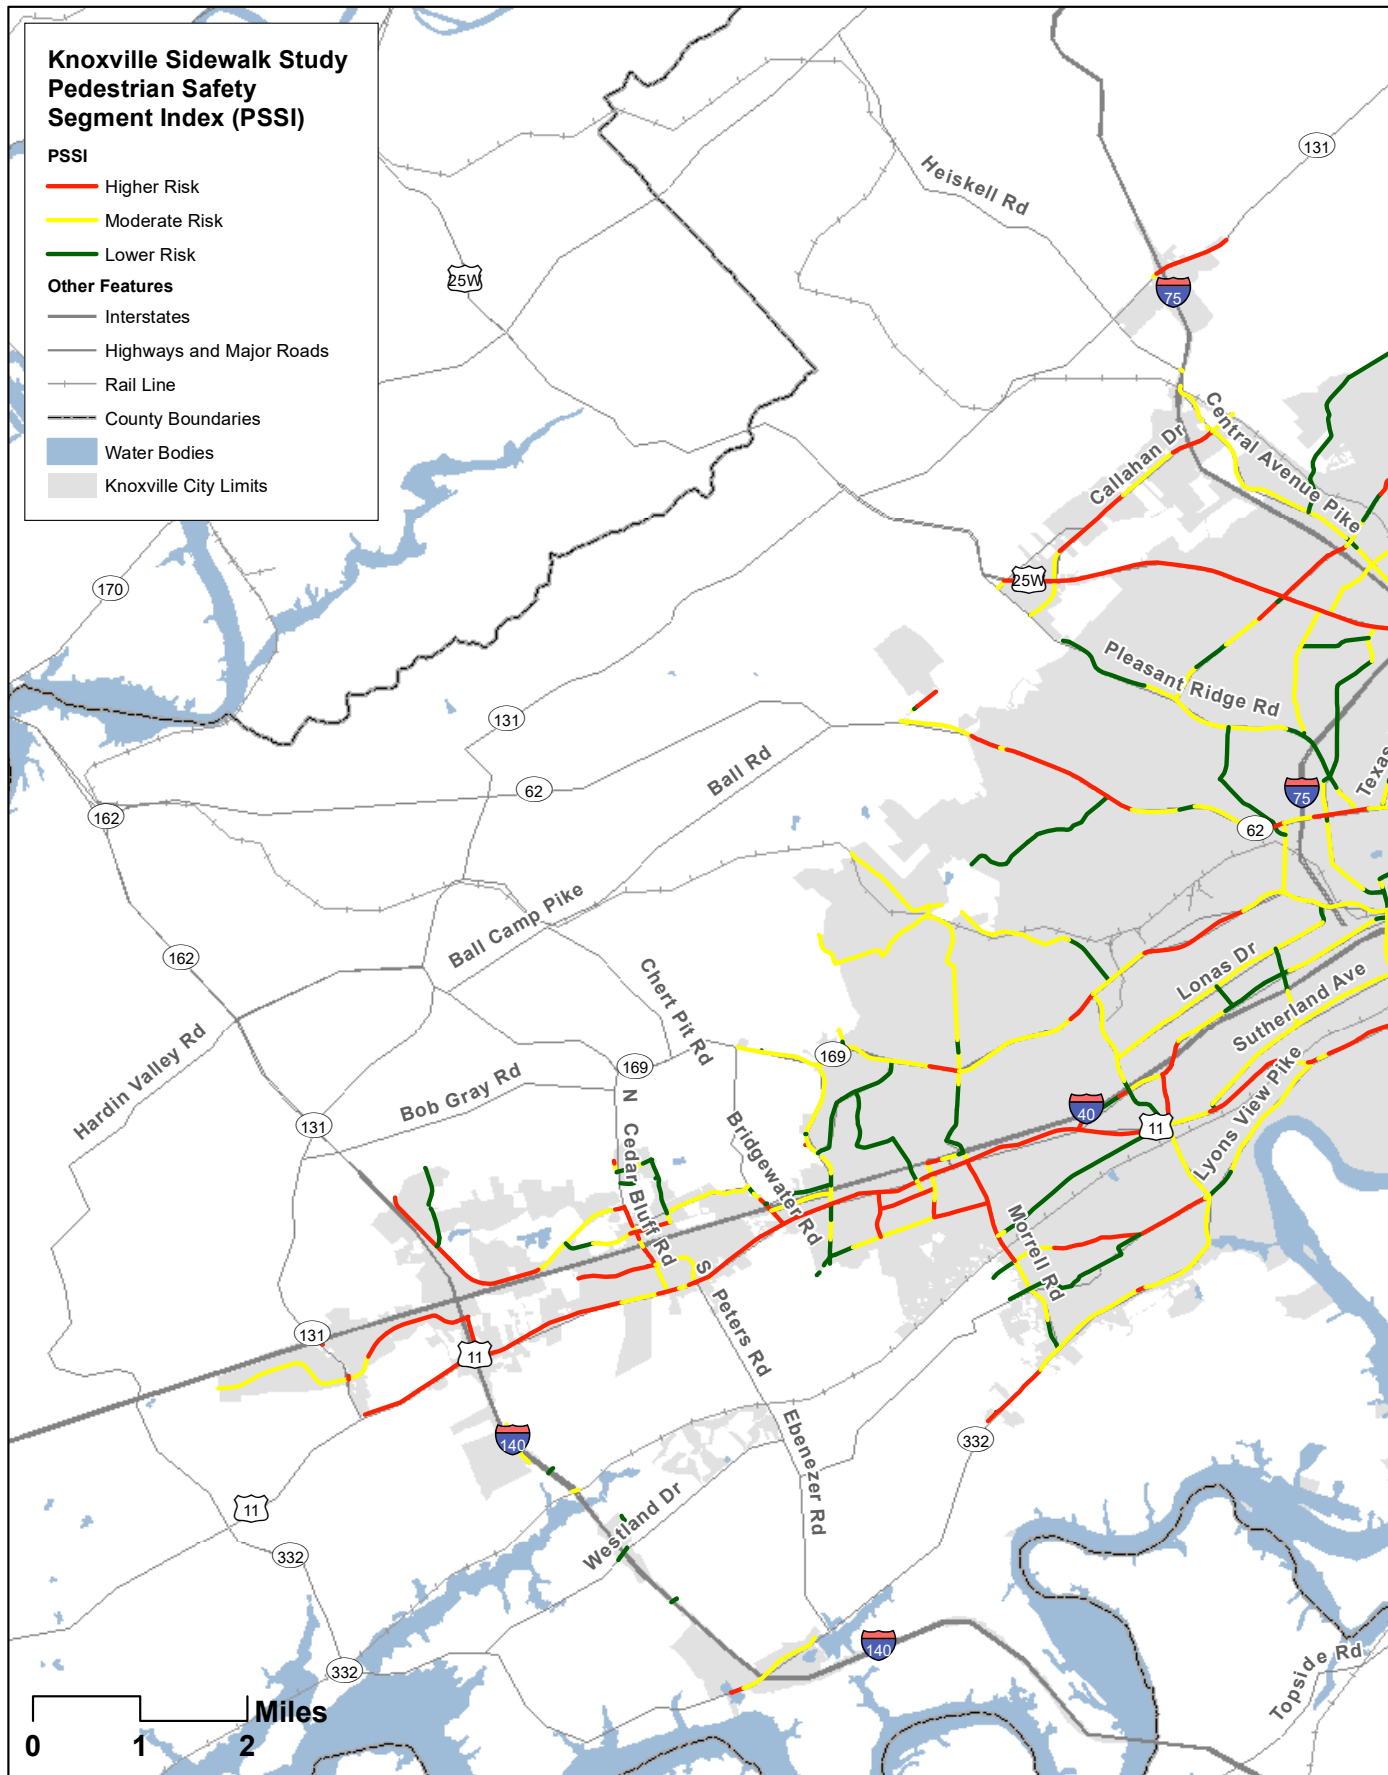

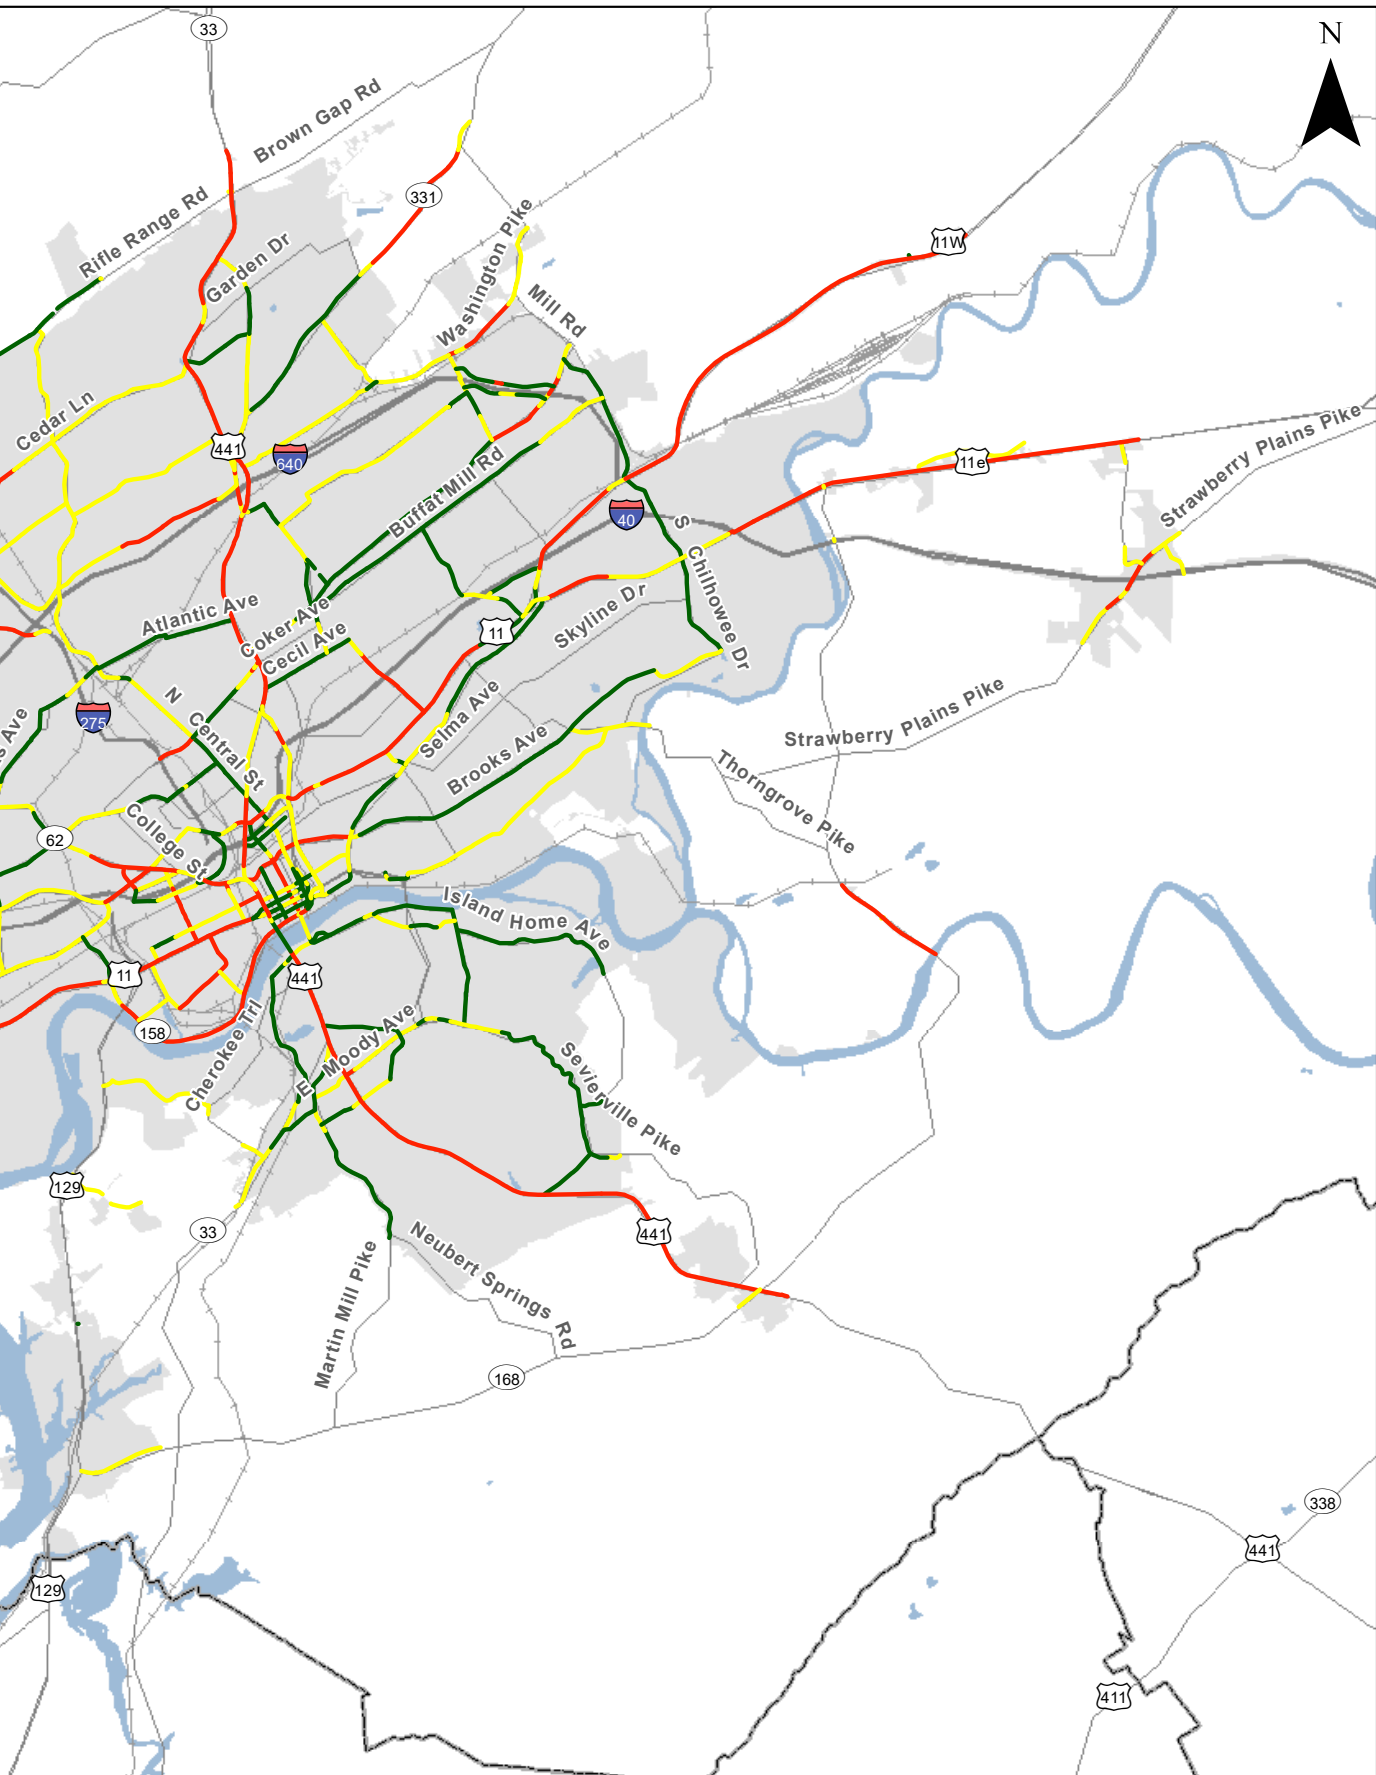

Figure 3-4. Pedestrian Safety Segment Index (PSSI)

To better capture this relationship between pedestrian crashes and roadway characteristics, a Pedestrian Safety Segment Index (PSSI) was developed for functionally-classified roadways (minus controlled-access facilities) in the city, using a methodology originally developed by TDOT. The PSSI uses both crash data and roadway characteristics to highlight relative levels of pedestrian risk.

As shown in Table 3-2, each category’s metrics are scored on a scale of ‘1’ to ‘5,’ with ‘5’ representing a higher level of risk for that category and ‘1’ representing a lower level of risk. Some categories, such as pedestrian access, are scored in a binary fashion as either ‘1’ or ‘5;’ others, such as Annual Average Daily Traffic, are scored by assigning scores between ‘1’ and ‘5’ to the data range. The sum of all categories’ scores results in the PSSI.

Table 3-2. Pedestrian Safety Segment Index (PSSI) Criteria

Score Method	Metric
2007 - 2018 Ped Crashes Severity of Injury	Fatalities Serious Injury Injury
2008 - 2018 Ped Crashes Number of Crashes	Higher Frequency Lower Frequency
Annual Average Daily Traffic	Higher Volume Lower Volume
Number of Travel Lanes	Higher Number Lower Number
Posted Speed Limit	Higher Posted Speed Lower Posted Speed
Pedestrian Access	No Sidewalks Present Sidewalks Present
Pedestrian Protection	No Bike Lane Present Bike Lane Present
Crossing Risk	Multi-Lane, No Median Multi-Lane with Median or Turn Lane Two Lane

As shown in Figure 3-4, many of the roadways identified as higher risk include key urban arterials such as Kingston Pike/Cumberland Avenue, North Broadway, Magnolia Avenue, Western Avenue, and Clinton Highway. However, some urban collectors are also higher risk locations for pedestrians, including West 5th Avenue, Ray Mears Boulevard, Downtown West Boulevard, and Executive Park Drive.

While many of these locations have “network gaps” or lack sidewalks entirely, others have existing sidewalks, suggesting that alleviating pedestrian safety risk goes beyond the provision of sidewalk infrastructure. Additional safety countermeasures, such as improved crossings, new or improved lighting or illumination, and traffic calming measures may be needed to complement new or improved sidewalk infrastructure.

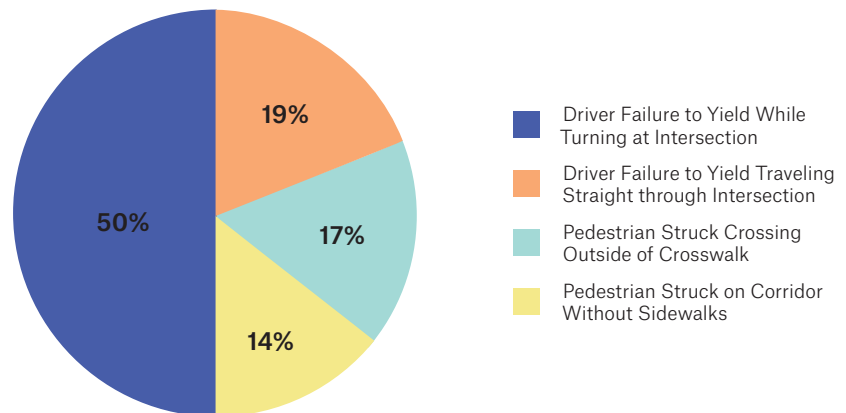

Aggravating Factors for Pedestrian Crashes

While not every crash can be attributed to a single primary cause, approximately 40 percent of the pedestrian crashes reviewed could be assigned to four prime aggravating factors.

1. **Driver Failure to Yield While Turning at Intersection** – These are crashes where the pedestrian was behaving properly while walking along or across a street, and the driver failed to yield while executing a turn.
2. **Pedestrian Struck on Corridor Without Sidewalks** – These are crashes where the pedestrian was walking along a street without sidewalks and was struck by a vehicle.
3. **Driver Failure to Yield Traveling Straight Through Intersection** – These are crashes where the pedestrian was crossing the street in a legally-recognized crosswalk, marked or unmarked, and was struck by a vehicle.
4. **Pedestrian Struck Crossing Outside of Crosswalk** – These are crashes where a pedestrian was struck while crossing the street at a location other than an intersection or marked midblock crossing.

Figure 3-5 indicates the distribution of crash factors.

Figure 3-5. Knoxville: Percent of Pedestrian Crashes by Aggravating Factor (2007-2017)

Of the classifiable factors, over two-thirds of crashes (69 percent) occurred at intersections, and 14 percent occurred at locations without a sidewalk. Detailed location studies to identify facility issues, driver and pedestrian education, and the construction of new sidewalks are all important strategies to reduce pedestrian crashes.

Table 3-4 lists the streets in Knoxville with no existing sidewalks where pedestrian crashes have occurred.

3.3 Health and Equity Analysis

In response to feedback received at the stakeholder meetings, a health and equity analysis was conducted as part of the pedestrian system analysis. The analysis identified areas of the city, at the Census Block Group level, with high concentrations of vulnerable populations; that is, residents who are more dependent on sidewalks and transit networks to access destinations, as well as residents in need of pedestrian infrastructure to improve health outcomes. The final health and equity composite score was based on the proportion of the population or households with the following health and socioeconomic factors:

1. Under age 18;
2. Over age 65;
3. Households at or below the federal poverty level;
4. Hispanic/Latinx;
5. Non-white;
6. Households without a vehicle;
7. Disability status;
8. Obesity in adults;
9. Diabetes in adults;
10. No leisure time physical activity in adults;
11. Poor mental health for more than 14 days in adults; and
12. Lack of health insurance among adults.

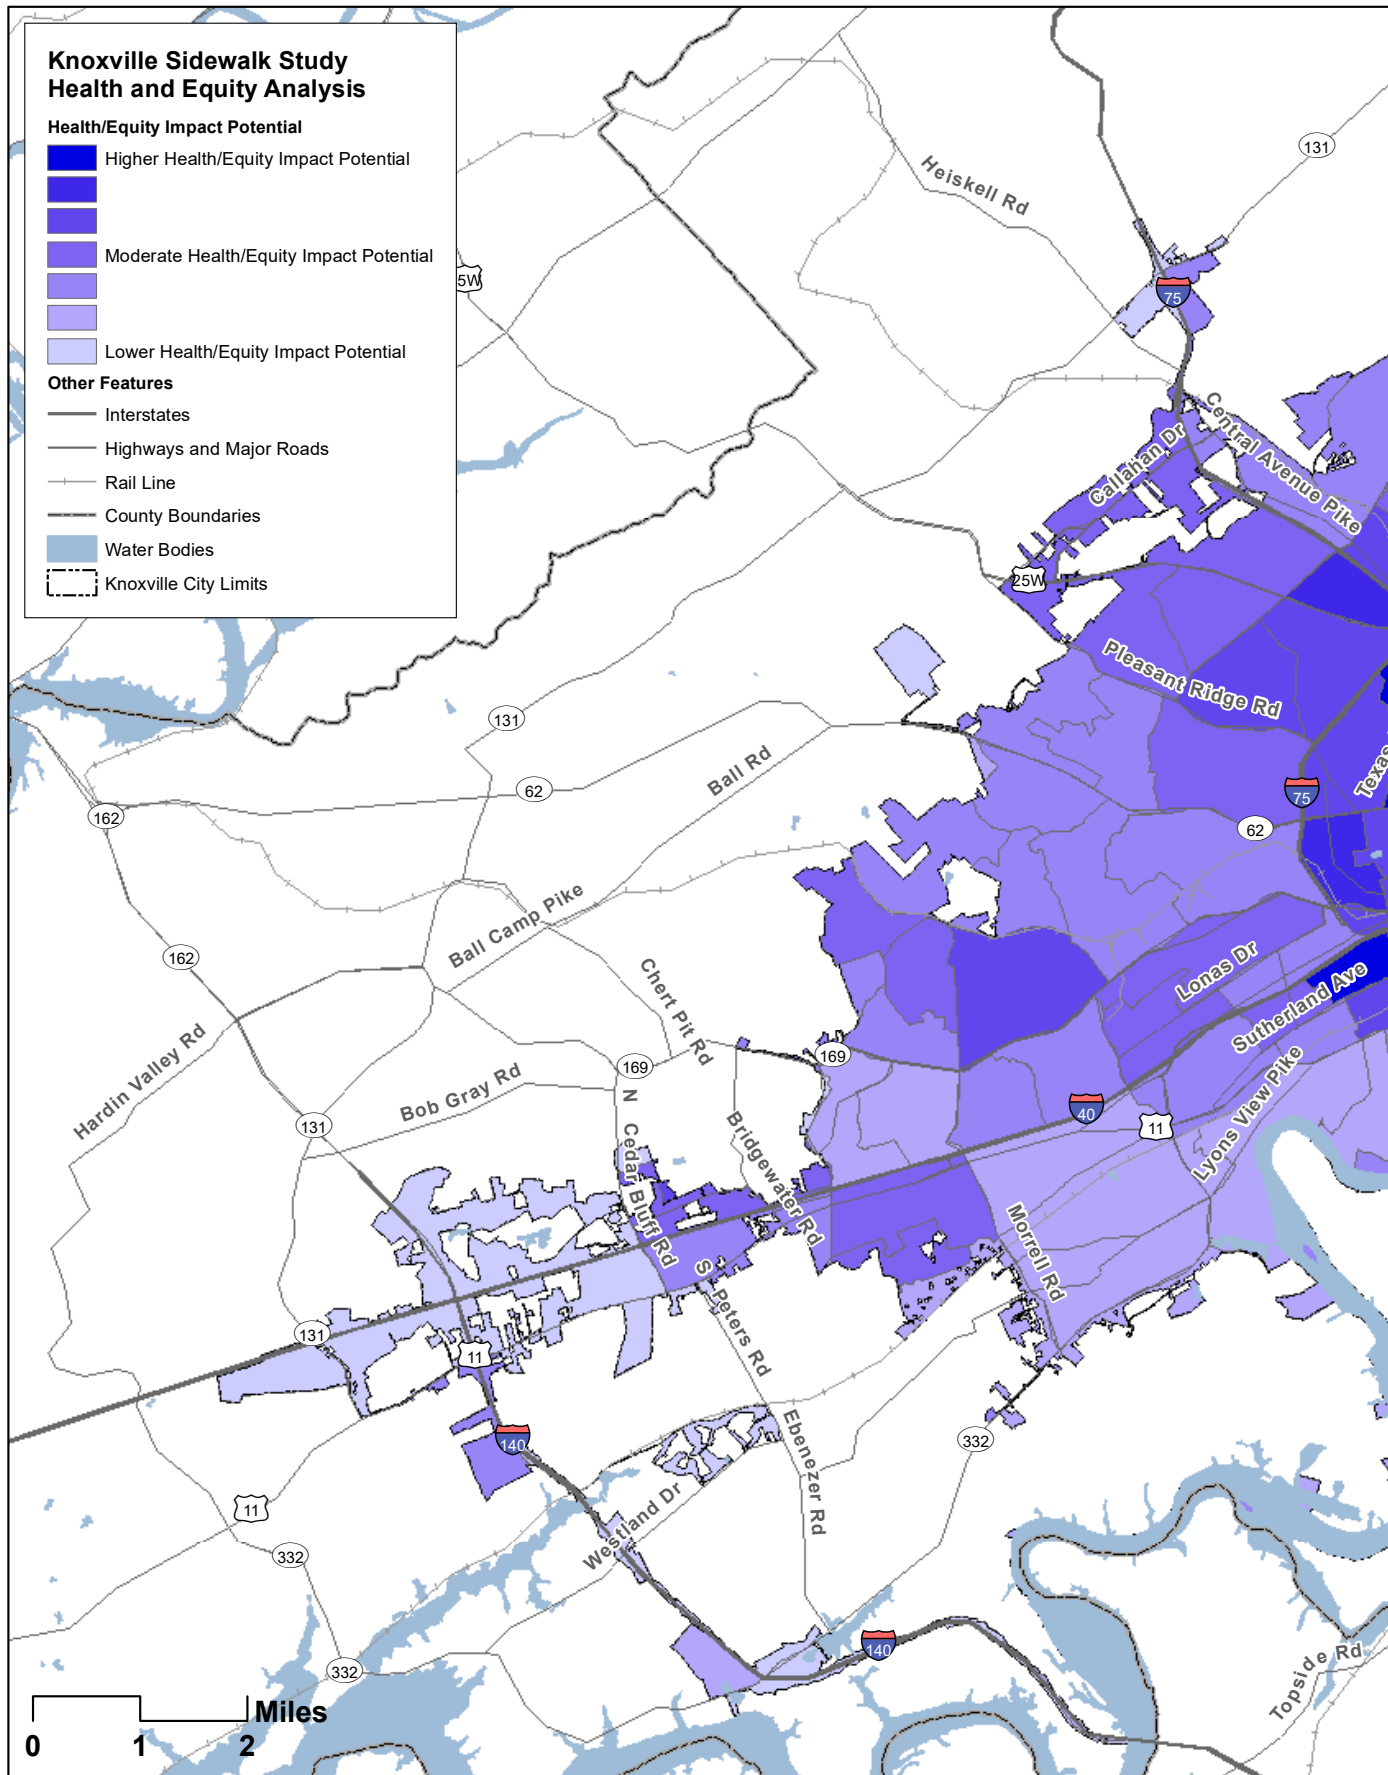

The factors are based on the latest estimates from two key data sources. Factors '1' through '7' are based on data reported by the U.S. Census Bureau American Community Survey (ACS) 2013 – 2017 5-Year Estimates. Factors '8' through '12' are based on 2017 data estimates reported in the Centers for Disease Control and Prevention (CDC) 500 Cities Project dataset.

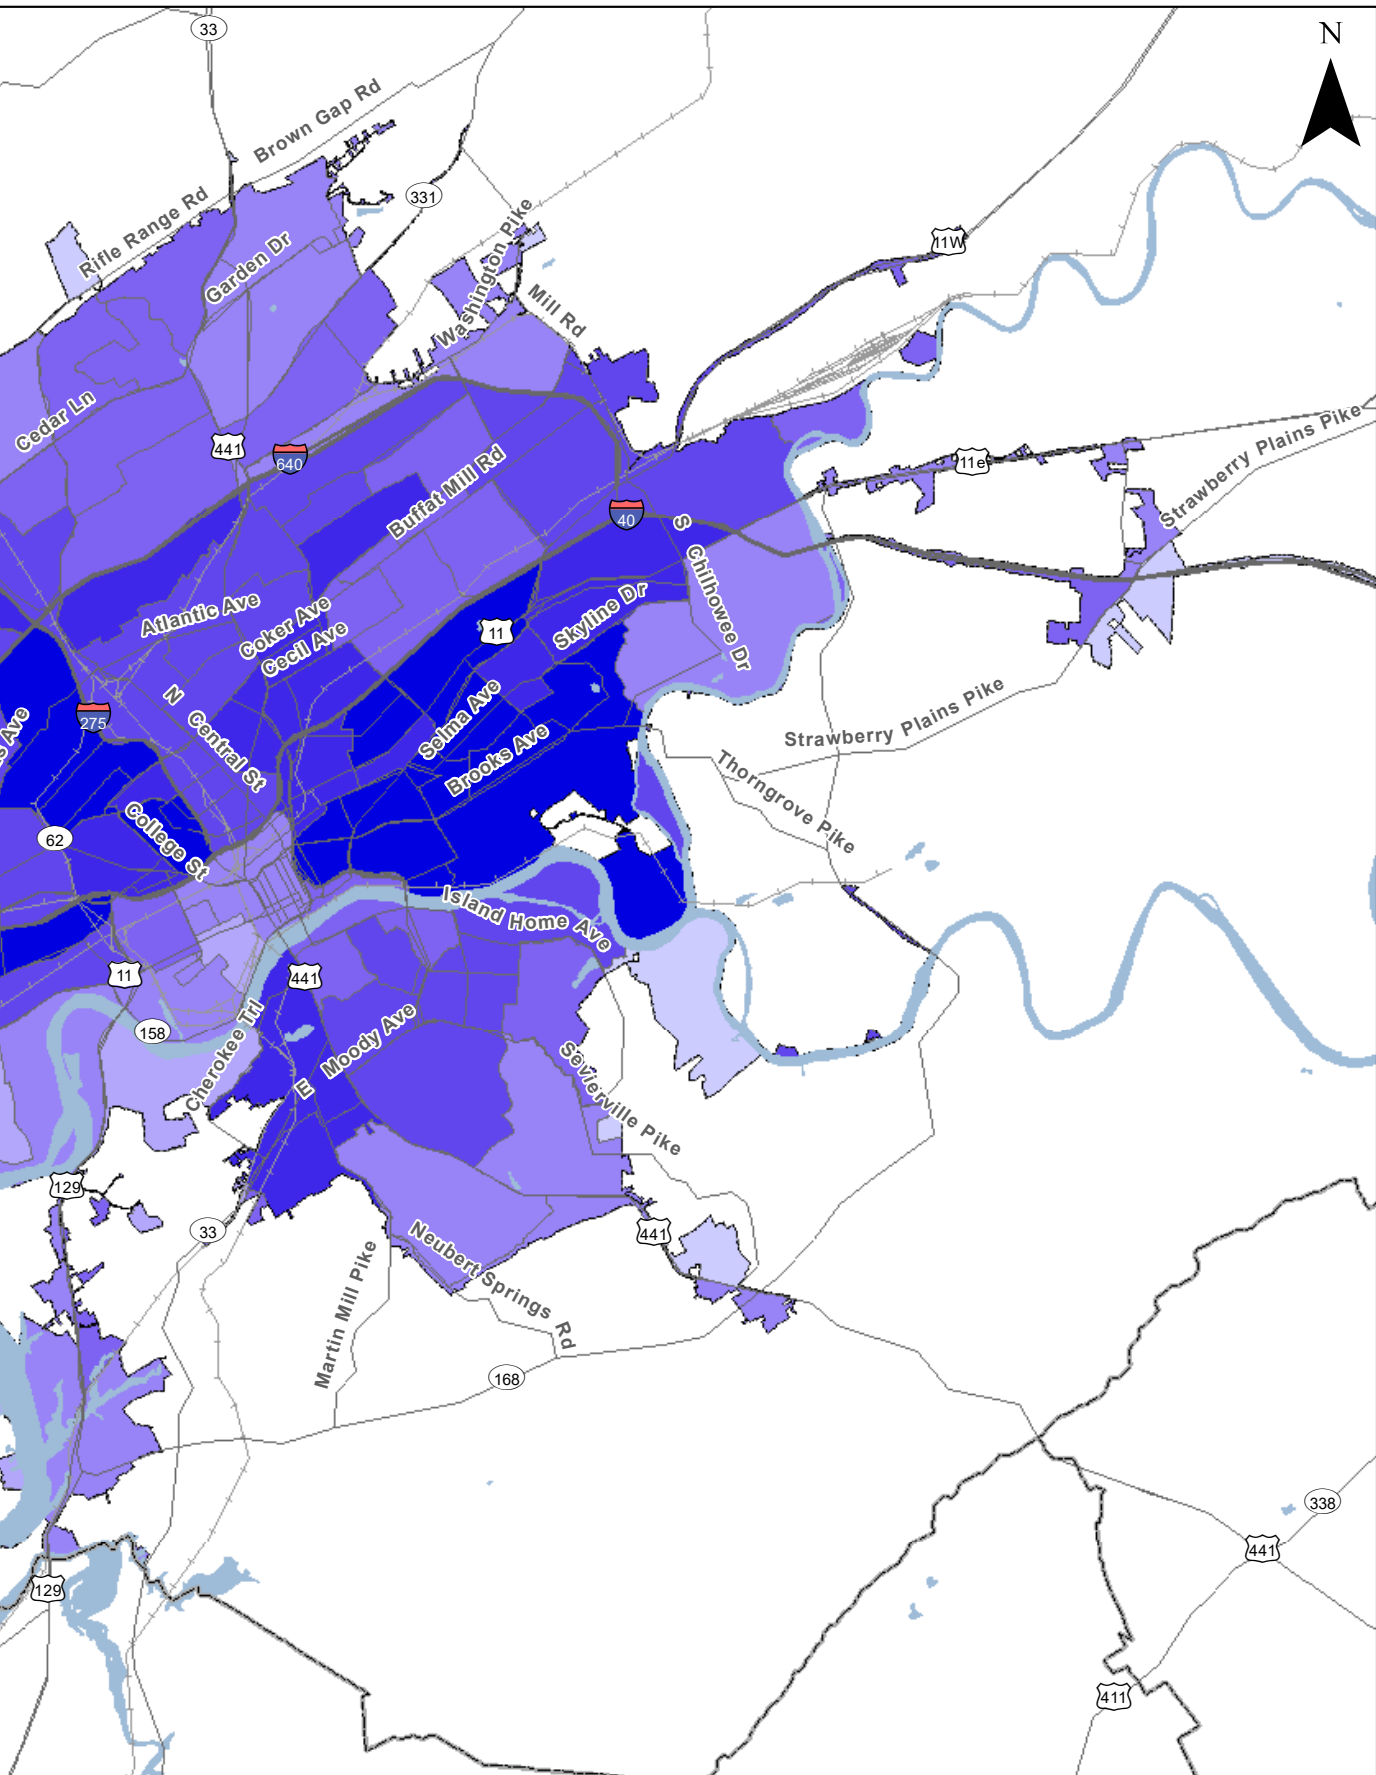

As shown in Figure 3-6, the health and equity analysis identified Census Block Groups in the City of Knoxville with a higher proportion of vulnerable populations that would likely benefit from an improved pedestrian environment.

Three areas with higher composite health and equity scores include:

- East Knoxville;
- North of Sutherland Avenue near John Tarleton Park; and
- Lonsdale neighborhood.

Figure 3-6. Health and Equity Analysis Results

Areas with higher health and equity impact potential are generally located to the north and east of downtown, with fewer areas in West Knoxville. The health and equity results are incorporated into the project prioritization framework to ensure that neighborhoods with vulnerable populations are represented in both short- and long-term investment priorities.

3.4 Sidewalk “Network Gap” Analysis

Sidewalk “network gaps” were identified using several methods. The “network gap” analysis began with the comprehensive records of citizen sidewalk requests maintained by the City of Knoxville’s Engineering Department. As discussed in Section 2.3, these requests were received through direct citizen contact with the City via Knoxville 3-1-1, email, or engagement through neighborhood or sector studies and plans. These existing requests were integrated into an overall digital sidewalk map database. In addition to the existing sidewalk project requests, an online interactive map was deployed during the public engagement phase of the study. The map was optimized to allow visitors to suggest new sidewalks, identify existing gaps in the network, and comment on currently-planned projects. The public engagement process also generated several project requests at the public workshops that were integrated into the mapping database.

“Network Gap” Definition

Sidewalk “network gaps” are sections along (1) any public roadway that lacks a sidewalk on either side, (2) arterial roadways and high volume collectors that lack a sidewalk on one or both sides of the road, or (3) any public roadway missing segments of sidewalk between two separate sections of existing sidewalk. Addressing existing “network gaps” in the network better accommodates the needs of all pedestrians by connecting two separate sections of the sidewalk network and benefiting a larger geographic area. In contrast, a sidewalk extension expands the existing network, usually to connect a specific location, such as a school or park, or to accommodate new development. Whether a roadway with a sidewalk missing on a single side is considered a “network gap” can be subjective. For the purposes of this study, the functional classification of the roadway is used as a guide to define sidewalk “network gaps”.

Table 3-5 provides definitions of each roadway classification, as defined in the 2018 Knoxville-Knox County Major Road Plan, as well as the criteria by which a sidewalk gap is identified.

Table 3-5. Functional Classifications and “Network Gap” Criteria

Functional Classification	Definition	“Network Gap” Gap Criteria
Interstate	A divided highway, designated under the Interstate Highway System, designed for the safe, unimpeded movement of large volumes of through traffic with full access control and grade separation at intersections. Interchange spacing is typically greater than one mile.	Sidewalks should not exist on roadways classified as interstates, however paralleling pedestrian connectivity (multi-use trails/greenways) may be implemented as warranted and feasible.
Expressway	A divided highway designed for the safe, unimpeded movement of large volumes of through traffic. Intersection grade separation and full access control is desired, however may contain occasional at grade intersections. Intersection spacing is typically one mile or greater.	In rare, specific instances, sidewalks may be implemented on Expressways, but a major caveat is crossing points and accessibility. Access control and the distance between at-grade intersections creates major hurdles to accessibility and crossing the roadways. In addition, because all Expressways are State or US routes under the authority of TDOT, coordination of any feasible pedestrian facility must be coordinated and approved by TDOT. Under current conditions, the construction of sidewalks on any expressways in Knoxville is not warranted.
Major Arterial	A street that provides major movement within the area, provides intercommunity connections to the local street system and moves through traffic between activity centers. Access control is desirable. The spacing of Major Arterials is typically 1/8-1/4 mile in a downtown, 1/4-1/2 mile in urban areas, 1/2-1 mile in suburban areas and greater than 1 mile in rural areas. Intersection spacing of Major Arterials is typically 1/2 mile or greater.	Sidewalks are desired on Major Arterials, but access and roadway crossings must be well conceived. In addition, installation of sidewalks on both sides of Major Arterials is critical due to limited crossings and high traffic volumes.
Minor Arterial	A street that augments the principal arterial system, carries trips of moderate length and moves through traffic between activity centers. Access control is desirable. The spacing of Minor Arterials is typically 1/8-1/4 mile in a downtown, 1/4-1/2 mile in urban areas, 1/2-1 mile in suburban areas and greater than 1 mile in rural areas. Intersection spacing of Minor Arterials is typically 400 feet or greater.	Sidewalks are desired on Minor Arterials, but access and roadway crossings must be well conceived. In addition, installation of sidewalks on both sides of Minor Arterials is recommended due to limited crossings and high traffic volumes.
Major Collector	A street that primarily provides for short distance traffic movement and primarily functions to collect and distribute traffic between local streets and high-volume traffic generators and arterials. The spacing of Major Collectors is typically 1/2 mile and intersection spacing is typically 300 feet or greater.	Minor Collectors should typically have sidewalk on one side of the roadway, with sidewalks on both sides being preferred.
Minor Collector	A street that primarily functions to collect and distribute traffic between local streets and arterials and provides direct access to abutting land. The spacing of Minor Collectors is typically 1/2 mile or less and intersection spacing is typically around 300 feet.	Minor Collectors should typically have sidewalk on one side of the roadway, with sidewalks on both sides being preferred.
Local Street	A minor street that provides direct access to abutting land. Intersection spacing of Local Streets is 125 feet or greater.	Location-specific attributes, topography, site distances and traffic volumes as well as pedestrian demand should dictate the necessity of sidewalks on roadways classified as a Local Street.
Alley	Alleys are rights-of-way, dedicated to public use typically for one-way traffic flow, which affords a secondary means of vehicular access to the back or side of properties otherwise abutting a street and which may be used for public utility purposes. Alleys shall have a minimum right-of-way of 20 feet.	Due to low speed and low volume, in most cases, sidewalks are not necessary and typically not feasible within alleys.

Section 4.0

Infrastructure Development

4.1 Pedestrian Network Plan

The results of the pedestrian system analysis provide the basis for the pedestrian network plan (PNP). The overall PNP represents a list of potential pedestrian network improvement projects unconstrained by funding levels or a complete feasibility or constructability review. The primary purpose of the PNP is to identify the facilities needed to establish sufficient network connectivity through the construction of new sidewalks along existing roadways. The PNP does not include pedestrian and multi-use path projects identified in the 2016 Greenway Corridor Feasibility and Assessment Study.

As shown in Figures 4-1 through 4-7, the PNP includes sidewalk projects in all six city council districts. The PNP contains a total of 410 miles of proposed sidewalks, which, if all identified projects were built, will increase the total sidewalk network from 345 to 755 miles, and the total linear feet of sidewalk per capita from 10.9 to 21.6 feet.

In addition to the new sidewalk projects shown in Figures 4-1 through 4-7, the study also includes a number of “potential corridor improvement” projects in each council district. These projects consist of existing sidewalks which need to be evaluated for potential improvements, and were identified through a review of pedestrian crash data or feedback from the public.

The PNP is not intended to address maintenance, repair, or modification of existing pedestrian facilities. The PNP proposes a snapshot of identified new facility needs and should be updated regularly to accommodate changes in land use, population densities, and other changes that would affect the location and needs of new pedestrian infrastructure.

Full implementation of all sidewalk recommendations is highly unlikely in the near future. As such, the PNP includes prioritization factors to identify strategic investments the city can make over time, ultimately working toward a larger and more accessible citywide sidewalk network.

The full listing of all sidewalk projects, including both new sidewalk and potential corridor improvement projects, are listed by city council district in Appendix A.

4.2 Pedestrian Network Segment List and Cost Estimates

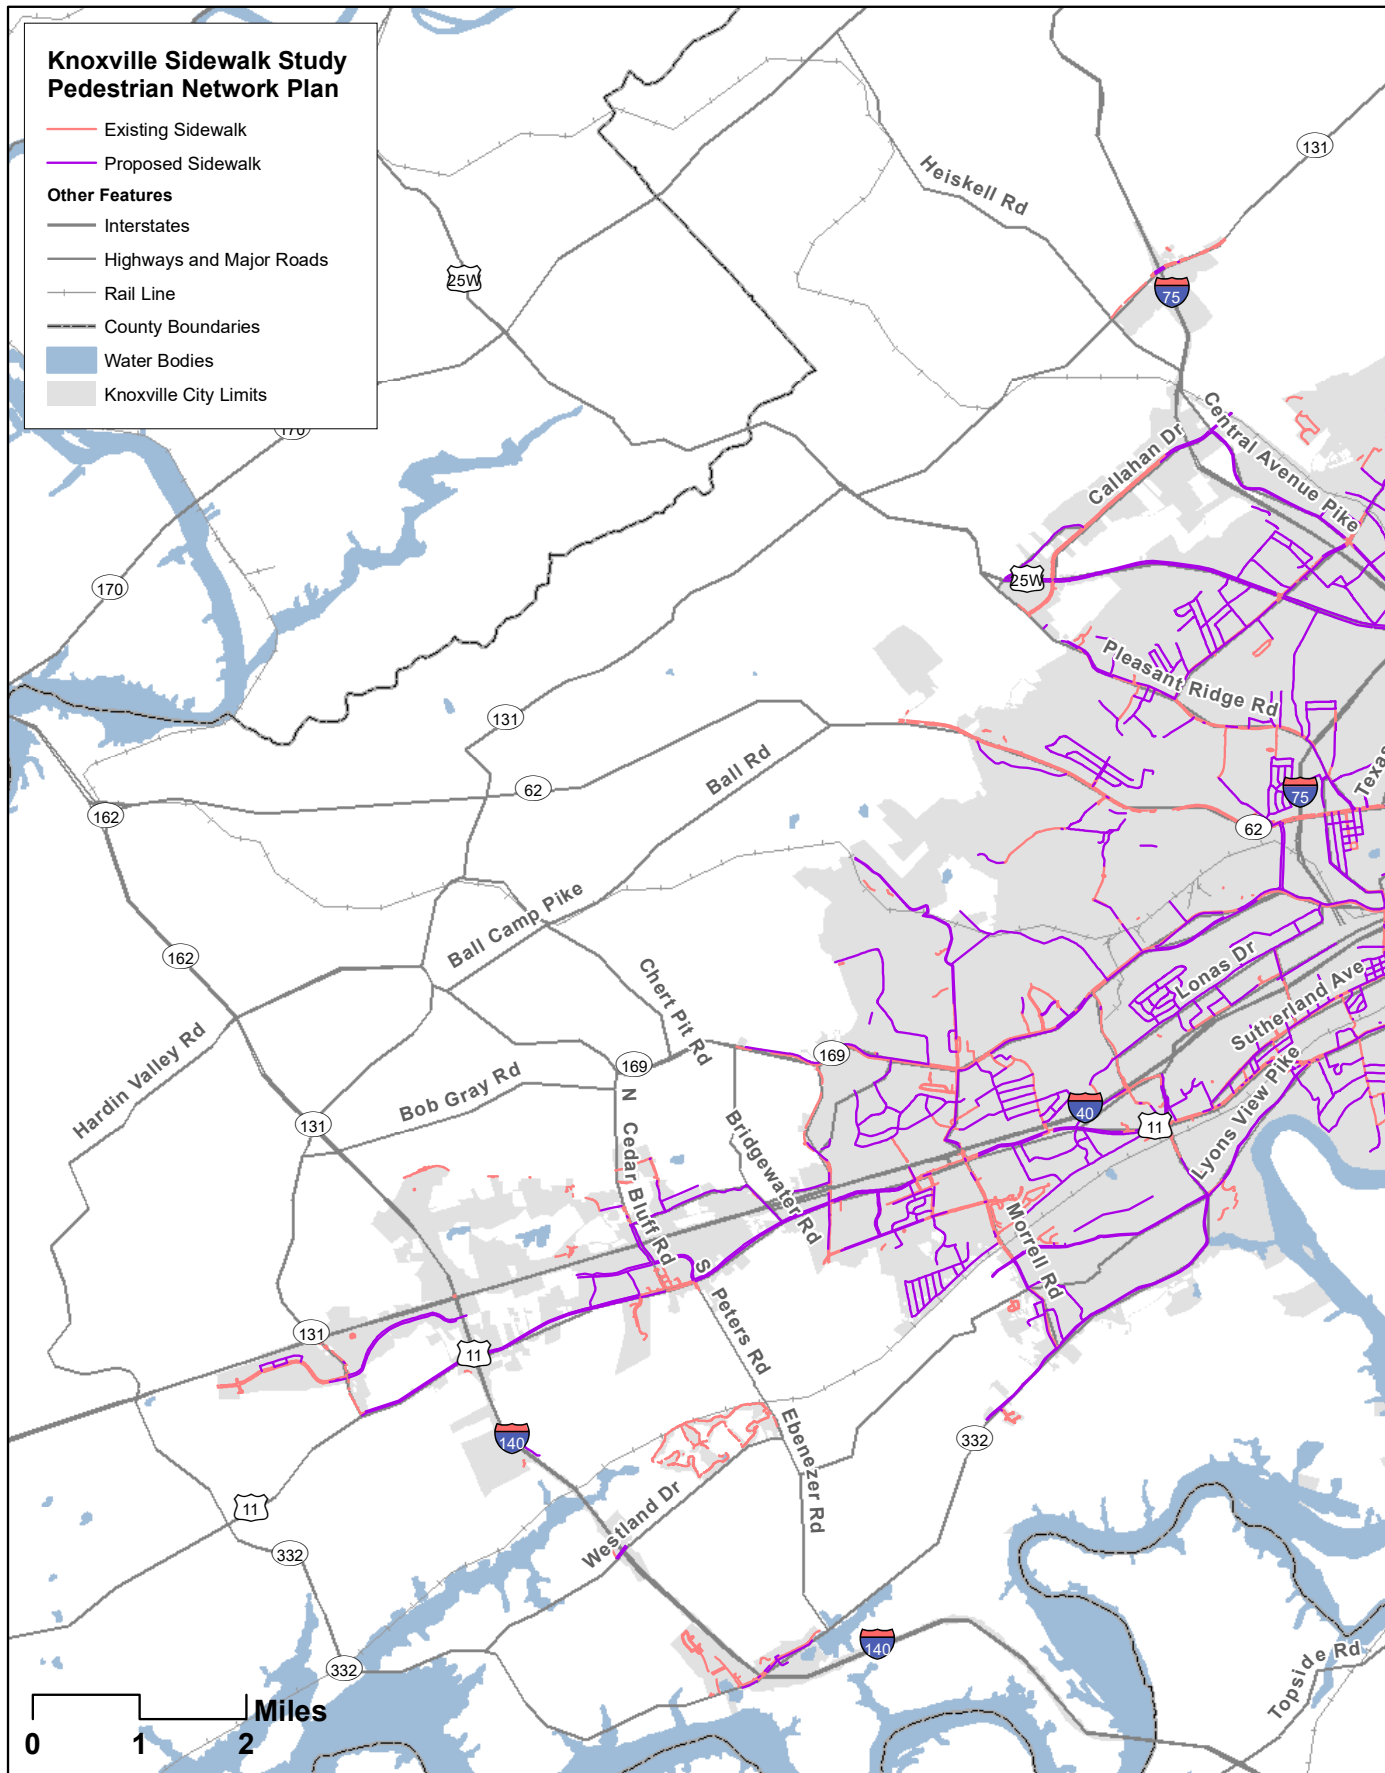

Cost estimation was performed using prevailing design and construction costs. Due to the variety in the types of projects, cost estimation was completed on a template basis by roadway functional classification. Table 4-1 shows the cost assumptions, per linear foot, associated with each roadway type.

It is important to note that the estimates generated for the study are for budgetary purposes and must take into account variables that will require, at a minimum, preliminary design to define a more accurate estimate of probable cost. As such, costs identified in the study will likely be, on average, higher than the actual final project costs. In turn, a small percentage of projects may exceed the study cost estimate due to unusual project-specific elements such as storm drainage issues, the need for retaining walls, and/or bridge or structural requirements.

Table 4-1. Cost per Linear Foot Assumption by Functional Classification

Roadway Functional Classification	Cost per Linear Foot
Local	\$745
Minor Collector	\$833
Major Collector	\$840
Minor Arterial	\$893
Major Arterial	\$901

4.3 Constructability Reviews

Consistent with the study’s recommendation for a proactive “design ahead” approach, a thorough constructability review was conducted for 10 key project recommendations (see Table 4-2). Six of the projects are top new sidewalk construction projects (based on project prioritization score) in each of the city’s six council districts. The remaining four projects were identified in response to demonstrated pedestrian safety needs, which were addressed through either new sidewalk recommendations or the identification of safety countermeasures. The review emphasized preliminary feasibility and constructability, providing a high level of confidence that the projects are appropriate for inclusion into the city’s Five-Year Implementation Plan (once developed) and may be implemented, assuming appropriate funding has been allocated.

Project constructability included, but was not necessarily limited to:

1. Preliminary right-of-way and easement requirements;
2. Utility conflicts/coordination and relocation requirements;
3. Railroad crossings;
4. Construction-time traffic and property owner impacts;
5. Driveway and private walk tie-ins;
6. Retaining wall requirements;
7. Environmental permitting requirements;
8. Ancillary improvements needed (pedestrian signals, bridge widening); and
9. Overall Cost feasibility.

The constructability ensures the City of Knoxville has an inventory of pre-screened projects ready for final design and construction once capital funding is allocated for project implementation.

The full constructability review is located in Appendix B.

Table 4-2. Constructability Review – Pilot Projects

Street	From	To	Type of Project	Project Length (Linear Feet)	Council District

CITY OF KNOXVILLE

Appendix B

Constructability Review

Appendix B.

Constructability

Review Summaries

New Sidewalk Projects

Chapman Highway from West Moody Avenue to East Young High Pike

The Chapman Highway sidewalk project from Moody Ave to Young High Pike is based on the recommendations as presented in the Chapman Highway Implementation Plan – Final Report, August 2019 prepared by Kimley Horn. For the constructability plan and cost estimate the provided typical section from that plan was taken and used to create a template that placed the sidewalk in its correct horizontal and vertical location based on existing edge of pavement. Except for the very beginning of the project where a fairly significant cut in front of the Walgreen's store is modeled, most of the project cross sections are fairly flat due to the history of commercial development in the area. Most of the constructability issues for this corridor will be based on working in and around the built environment, including the removal of landscaping on several parcels, relocation of utilities, and the development of a traffic control plan that maintains access to the many businesses in the area.

To maintain the safety of this new pedestrian facility areas are shown where modifications to the access to certain parcels are suggested. Wong's Palace and the fuel center at the intersection of Chapman Highway and Young High Pike are both locations that have three existing access points. The most egregious of these is the driveway immediately adjacent the signalized intersection on Chapman Highway at Young High Pike. The review recommended closing this driveway completely in conjunction with installation of sidewalk and pedestrian facilities accessing the existing crosswalk. While the review shows closing one of the three driveways at Wong's Palace parcel, it should be noted that a parking lot reconfiguration should be engineered to accommodate this closure. Besides the potential need to reconfigure parking at Wong's Palace should access control measures be implemented, it appears that there is only one other existing parking space on an adjacent parcel that is impacted.

Middlebrook Pike from Vanosdale Road to West Hills Road

The span of Middlebrook Pike from Vanosdale Road to West Hills Road includes three residential properties and one church property that will likely be impacted as a result of a proposed sidewalk project with the city's preferred typical section (2' landscaping strip and 5' sidewalk). Permanent right-of-way acquisitions are anticipated on all four tracts due to property lines being close to the existing roadway. Additionally, temporary property impacts are anticipated to tie-in slopes of yards and driveways behind the sidewalk. 5 driveways would be impacted as part of this project. The prepared cost estimate includes quantities to perform this work as well as estimates for the cost of ROW/Easement acquisitions.

The cost estimate also includes quantity to remove and reset fences for homes where applicable and allowances are in the cost estimate to replace in kind landscaping and trees on private property that are anticipated to be disturbed.

This span of Middlebrook Pike has existing curb and gutter and no additional underground drainage infrastructure work is anticipated. Potential utility impacts appear to be limited to adjusting manhole elevations where grading changes dictate and avoiding utility and traffic signal poles at the Southeast corner of the Middlebrook Pike and Vanosdale Road intersection. At this location there is a large amount of open space in front of Middlebrook United Methodist Church where the design can be altered to mitigate the potential impacts.

Glenn Avenue from Keith Avenue to Middlebrook Pike

Starting at the intersection with Keith Avenue, the first block of Glenn Avenue is bordered by a cemetery on the north side of the street and West View Park to the south. The initial field review required a look at installing the sidewalk on the south (park) side of the street for this first section as the topography adjacent to the cemetery is extremely steep with well-maintained landscaping and a monument entrance. Any attempt to construct on the cemetery side of the street would likely require shoring, the construction of cut-slope retaining walls, reconstruction of the entrance including steepening the drive, relocation of the entranceway, and potentially more small walls to protect monuments.

Installation of a sidewalk on the southern (Park) side of the street will require the removal and reconstruction of the existing split rail type fence from its current location to the back of the new sidewalk. Due to topography nearly the entire length of the sidewalk will be built on fill which will place material inside the canopy of significant trees making them candidates for removal. The placement of fill will also create a need to extend the outlet pipe for the aforementioned closed system drainage and will place fill material in a wet

weather conveyance that could prove to be a permitting issue. The typical section along Glenn Avenue will include a curb and gutter constructed at the existing edge of pavement and require the replacement of an existing brick drainage structure with an inlet and junction box. Behind the curb and gutter will be a 2' furnishing zone. It is anticipated that minor adjustments to the width of the furnish zone and alignment of the sidewalk will allow us to construct this section of sidewalk without relocating poles. Two entrances to the park will also have to be redesigned to accommodate the new sidewalk including a section of trail and a set of steps crafted from railroad ties.

The eastern (southeastern) border of the park is Denson Avenue. Past Denson Avenue all of the drainage from the upstream watershed including West View Park is piped under Denson Avenue and outlets into a roadside wet weather conveyance that continues along Glenn Avenue to Middlebrook Pike. For this initial constructability review and estimate it was decided to proceed along Glenn Avenue by first crossing Denson Avenue at the stop and then showing a non-stop controlled crossing across Glenn Avenue to access the North side of the street. This crossing will allow access to the trail to West View Elementary and avoid encapsulating the open channel and will minimize earthwork on adjacent residents. The North side of the road has some topography issues as is evident by driveway profiles 3-7 but appears to be the more constructible side of the street, barring unforeseen sub-surface issues. The remaining constructability issues are noted on the plan sheets and are generally limited to the removal and replacement of utility poles and mailboxes. The commercial lot at the intersection of Middlebrook and Glenn warrants coordination with the owner to identify the largest vehicle that accesses that site to ensure the driveway width and angle accommodate turning movements into and out of the site.

North Broadway from South of Gresham Road to South of Essary Drive

The east side of North Broadway from the existing sidewalk south of Essary Drive to the existing sidewalk in front of 5352 North Broadway is a highly developed commercial corridor which includes multiple business driveways and parking areas which could be impacted by a proposed sidewalk project. The biggest impacts of a proposed project along this corridor would be to commercial parking areas and above ground utilities. Due to the nature of the project's potential impacts, community coordination will be integral in the development of a final design. There is existing drainage infrastructure along the route, and it is assumed to have sufficient capacity and be in good condition.

The northern end of the project has three commercial building with frontage that is close to the outside travel lane and the space between is utilized for customer parking. Construction of a sidewalk here will likely result in the loss of parking spaces. There is some access to parking behind

these buildings, but coordination with the city's codes department would be required to ensure they meet the minimum threshold required for their businesses.

Immediately south of the commercial parking impacts there is a small grass area in front of 5320 North Broadway with relatively steep topography and utility poles and it is likely a small retaining wall will be required here. There is also existing shoulder area between the curb and outside lane where the project could potentially mitigate some slope impacts. Also, the installation of the city's preferred typical section in this area will impact some drainage inlets which would need to be reworked during construction.

Continuing south, the project would cross Hotel Avenue and the entrances to the Exxon gas station/service shop. At this location there are significant utility impacts which include large poles and above ground natural gas control boxes. According to available information the right of way is wide in this area and the city could use this space to mitigate utility impacts but would require taking space that is currently being utilized by the gas station/service shop for parking.

The rest of the project heading south has relatively flat topography and impacts from construction should be limited to small impacts outside the right of way for slope tie-ins and sidewalk construction.

East Columbia Avenue / Ledgerwood Avenue from Harvey Street to Paige Street

There are several sections of East Columbia Avenue and Ledgerwood Avenue that present acute challenges to the preliminary plans that have been produced. Most notable in this area is the terrain, especially in the 500, 600, and 700 blocks of East Columbia Avenue. Along these blocks there are several yards with steep slopes up to the existing edge of pavement. With the typical section that is preferred by the city (2' landscaping and 5' sidewalk) the grading that would be necessary cannot be accomplished without leaving a slope difficult to maintain or potentially undermining the structure or utilities. The cost estimate includes a premium cost on excavation as all the grading work in this area will be done by very small equipment in small sections of open working area. There is also a significant amount of retaining wall to address areas that we believe cannot be replaced with slopes, and allowances for rails in some fill areas. In addition, there is a premium put on ROW cost as some residents may oppose a sidewalk or a retaining wall in front of their house and will argue their property is damaged beyond the cost of the fee simple ROW needed for construction.

The cost estimate also includes fences for homes with front yard fences and estimated quantities for concrete steps where walkway and steps will need to be relocated to accommodate the wider street. Some areas have

significant landscaping and trees that are immediately adjacent to the existing street and potential on private ROW. Allowances are in the cost estimate to replace in kind the disturbed plantings on private property.

The presence of on-street parking presents some serious concerns for a few homes that do not have driveways or off-street parking. There are several homes that are served from the alleyway and others that are not set up for access to the home from the rear without having to walk through the yard to the front of the house. In particular, there is at least one known case where there is no driveway in front of the house and an above ground pool that precludes vehicular parking off the alley. Cost to cure estimates for these situations are included in the cost estimate and noted here in anticipation of push back from some neighbors.

Beaumont Avenue from McSpadden Street to West Baxter Avenue

The Beaumont Avenue project from McSpadden Street to West Baxter Avenue contains design elements that will need to be reviewed by the city and vetted through public input and stakeholder involvement. The most notable challenges to constructability are centered around these design elements as they include closing an existing alley, modification to control access, removing a street from the five-point intersection by making it a dead end.

The proposed changes better redefine this stretch of roadway, creating an improved sense of place for all adjacent landowners, and, most importantly, create a safe and efficient route to Beaumont Elementary School. Outside of these changes to the general character of the area, the additional challenges to construction are fairly typical including maintaining access to businesses and homes during construction, coordination with utilities, and building consensus with adjacent neighborhoods.

Safety Projects

West Martin Mill Pike from Chapman Highway to Atlantic Avenue

The west side of West Martin Mill Pike from Chapman Highway to Atlantic Avenue is a residential corridor with existing drainage infrastructure. The most notable challenge of this project will be in creating a safe crossing on Chapman Highway, which will likely require full upgrades to the traffic signals at the intersection to accommodate new pedestrian signals, as well as a signal to control vehicular movements from southbound Chapman Highway onto West Martin Mill Pike where there is no existing traffic control.

Heading south from Chapman Highway, the topography adjacent to the roadway is relatively flat and the proposed project will confront three commercial properties. Through this section the primary conflicts that are anticipated include a utility pole, a fence, and commercial driveway impacts. The utility pole appears to hold telecommunication lines as well as 3-phase power lines and relocation will need to be coordinated with their respective owners. Additionally, south of Melbourne Avenue there is a drainage structure that falls outside of the roadway alignment and it will likely need to be adjusted or reworked to ensure proper drainage once the project is constructed. The cost estimate also includes fences and bollards for businesses where applicable.

There is existing underground drainage infrastructure at the northern end of the project, which is assumed to have sufficient capacity and be in good condition. There is no existing curb along the project, and it is possible that the addition of new curb and or gutter could create conditions that would necessitate the installation of additional new drainage infrastructure.

East Summit Hill Drive from South of Hall of Fame Drive to Patton Street

The Summit Hill Drive sidewalk project from south of Hall of Fame Drive to Patton Street has been included in the list of projects due to safety concerns along the stretch of road. This block of Summit Hill is near the downtown business district with multifamily housing along the south side of the road and a Weigel's gas station on the north side of road. Through the evaluation process, this project received high ranks due to pedestrian accidents within the block area. There is an existing signalized crosswalk at the intersection of Summit Hill Drive and Hall of Fame Drive, but the next crosswalk along Summit Hill Drive is approximately, 1800 feet with residential along the southern side. This is a long stretch to expect pedestrian to try and cross the road to reach a destination. An additional crosswalk either at the intersection as shown or at a mid-block crossing between the two existing crosswalks would serve the area and help prevent crossing the road at random points that vehicle traffic is not anticipating. Since this would not

be a signalized crosswalk, the design should evaluate the use of static or flashing warning signs to assist vehicle traffic acknowledging the pedestrian crosswalk. Another consideration would be to install pedestrian safety rail along the sidewalk and road to help direct pedestrians to crossing points where traffic is anticipating.

Nadine Street from Coker Avenue to Cecil Avenue

The south/west Side of Nadine Street from Coker Avenue to the Cecil Avenue is a residential corridor with varying topography and no existing drainage infrastructure. The most notable challenge of this project will be the installation of a new drainage infrastructure system, which will require significant excavation and grading to ensure proper drainage is maintained without creating adverse conditions for adjacent properties and vehicles travelling through the project area.

There are a few points along the proposed project limits where adjacent topography is steep and will necessitate the installation of retaining walls. At the apartment complex near Coker Avenue, there is a potential parking impact of one to two spaces to accommodate the new driveway tie-in. In general, the homes are set back far enough from the road to limit concerns regarding grading issues and driveway tie-ins. The last home at the south end of the job is relatively close to the roadway and a retaining wall will likely be required to construct the sidewalk without impacting the structure.

The primary conflicts that are anticipated include utility poles, landscaping, driveway, and right-of-way impacts. The utility poles appear to hold telecommunication lines as well as power service drops and relocations will need to be coordinated with their respective owners. The cost estimate includes quantities for concrete walkways where walkway and steps will need to be relocated to accommodate the sidewalk. Some areas have landscaping and trees that are immediately adjacent to the existing street and potentially on private right-of-way. Allowances are in the cost estimate to replace in kind the disturbed plantings on private property.

There is no existing curb along the project and it is anticipated that the addition of new curb and or gutter will create conditions that would necessitate the installation of a new drainage infrastructure system.

Henegar Street from Atlantic Avenue to Ledgerwood Avenue

The east side of Henegar Street from Atlantic Avenue to the Ledgerwood Avenue is a residential corridor with existing drainage infrastructure. The most notable challenges of this project will be in the first block from Ledgerwood Avenue to Oglewood Avenue where the road is narrow and the homes are in close proximity to the existing pavement with steep topography which will likely necessitate a variance from the city's preferred typical section and the construction of retaining walls to be able to install a sidewalk through this section.

Heading north from Oglewood Avenue, the homes are set back further from the roadway and the topography is significantly flatter. Through this section the primary conflicts that are anticipated include utility pole, fence, and right of way impacts. The utility poles appear to hold telecommunication lines as well as power service drops, and relocations will need to be coordinated with their respective owners. Additionally, south of Melbourne Avenue there is a drainage structure that falls outside of the roadway alignment and it will likely need to be adjusted or reworked to ensure proper drainage once the project is constructed.

The cost estimate also includes fences for homes with front yard fences and estimated quantities for concrete walkways where walkway and steps will need to be relocated to accommodate the sidewalk. Some areas have landscaping and trees that are immediately adjacent to the existing street and potentially on private ROW. Allowances are in the cost estimate to replace in kind the disturbed plantings on private property.

There is existing underground drainage infrastructure along the route, and it is assumed to have sufficient capacity and be in good condition. There is no existing curb along the route, and it is possible that the addition of new curb and or gutter could create conditions that would necessitate the installation of additional new drainage infrastructure.

Some of the northern sections of Henegar Street have areas being utilized for on-street parking, but where applicable all homes appear to have private driveways.

PRELIMINARY DESIGN REVIEW

PROJECT NAME: Chapman Hwy. from W Moody Ave to W Young High Pike
 PROJECT NO: 43803
 DATE: June 10, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts	Sanitary Sewer Conflicts	W
Option 1	50'-52'	North	50'-52'	Post Curb	5'	0'	0'	7	0	

Sidewalk Length = 1460'

Option 1

- 6' sidewalk, post curb for bike lane.
- Requires 0 ROW takes
- Relocate 2 signs
- Existing gas line runs under entire project area
- 12 trees to be removed
- Closing 3 existing driveway entrances for access control

Arterial Boulevard Sidewalk Estimate (\$/lf)	Percent/Length	Cost/lf
Sidewalks - Arterial Roadways	100%	\$582
Drainage	90%	\$258
Contingency 10%	10%	
Engineering/CEI 25%	25%	
RoW - Residential Roadways	0%	\$0
RoW - Commercial Arterial Boulevard Roadways	10%	\$4
Easement - Arterial Boulevard Urban	75%	\$30
Damages - Arterial Boulevards Urban	50%	\$13
Appraisal/closing	100%	\$13
	Project length	1460
	Estimated Cost:	\$1,775,000
	Cost/lf:	\$1,216
	Sidewalks - Arterial Roadways	\$849,868.17
	Drainage	\$376,680
	Sub-Total Construction Costs:	\$1,227,000
	Contingency 10%	\$123,000
	Total Construction Costs:	\$1,350,000
	Engineering/CEI 25%	\$338,000
	RoW - Residential Roadways	\$0
	RoW - Commercial Arterial Boulevard Roadways Urban	\$5,840
	Easement - Arterial Boulevard Urban	\$43,800
	Damages - Arterial Boulevards Urban	\$18,250
	Appraisal/closing	\$18,980
	RoW & Easement Acquisition/Damages/Appraisals	\$87,000

PRELIMINARY DESIGN REVIEW OPTIONS

PROJECT NAME: Middlebrook Pike from Vanosdale Road to West Hills Road Sidewalk Improvements
PROJECT NO: 43803.00
DATE: June 9, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Water Meter, Valve, and Hydrant Conflicts
Option 1	23'	South	23'	Prop C&G	5'	2'	none	1
Sidewalk Length = 946 LF								

Option 1

- Install 5' sidewalk and 2' furnishing zone; use existing C&G and construct C&G at driveway aprons and where repairs are necessary
- Bus stop at Middlebrook Pike and West Hills Road; may transition to no furnishing zone to grant access and reduce impact to landscaping
- Layout was not based on survey, so the number of conflicts and the design is subject to change. Cut/fill and driveway tie-in lengths are an approximation
- Layout to be adjusted around utilities at Vanosdale Road and Middlebrook Pike to minimize impacts; may need to take ROW
- Potential water meter, sanitary cleanout, water service line, and sanitary service line adjustments on each property
- Adjust or relocate 1 fire hydrant
- Relocate 2 signs
- Relocate 2 mailboxes
- Adjust 1 manhole (utility unknown)
- Reset existing fence along Middlebrook Pike side of 823 West Hills Road
- Transition sidewalk to no furnishing zone where necessary
- Potential tree impacts at 7208 Middlebrook Pike

PRELIMINARY DESIGN RE

PROJECT NAME: Glenn Avenue from Keith Avenue to Middlebrook Pike
PROJECT NO: xxx-xxx
DATE: June 9, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts	Sanitary Sewer Conflicts
Option 1	21'-24'	North	21'-24'	Prop C&G	5'	2'	0'	13	0
Sidewalk Length = 1512'									

Option 1 (Planning Option)

- Follows Planning option: 5' sidewalk, 2' Furnishing Zone, Curb and Gutter.
- Requires 0 ROW takes
- Relocate 14 mailboxes
- Reset existing fence on Park side of Glenn Ave.
- Relocate 4 signs
- Existing gas line runs under entire project area
- Trees to be removed 3 tracts
- Extension of existing cross drain under Denson Ave.

Local Roads Sidewalk Estimate (\$/lf)	Percent/Length	Cost/lf
Sidewalks - Local Roadways	100%	\$296.66

North Broadway Street Sidewalk Improvements

PRELIMINARY DESIGN REVIEW OP

PROJECT NAME: North Broadway Street from Fountain View Plaza to Gresham Road Sidewalk Improvements
PROJECT NO: 43803.00
DATE: June 10, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Water Meter, Valve, and Hydrant Conflicts
Option 1	50'-84'	East	50'-84'	Prop C&G	5'	Varies	none	3
Sidewalk Length = 1110 LF								

Option 1

- Install 5' sidewalk and furnishing zone; use existing C&G where possible and construct C&G elsewhere
- Furnishing zone width varies to avoid impacts
- Layout was not based on survey, so the number of conflicts and design is subject to change
- Sidewalk layout from 5334 N Broadway St to the end of project may need to be coordinated with commercial properties due to the impact the sidewalk will have on their parking
- The sidewalk may not leave enough room for the current parking locations along N Broadway St
- Potential water meter, sanitary cleanout, water service line, and sanitary service line adjustments on each property
- Relocate 1 fire hydrant
- Relocate 2 poles and 3 guy wires
- Relocate 1 utility pullbox, 1 gas controller, and 3 bollards
- Relocate 1 pedestrian push button
- Relocate 2 signs

NOTES:

1. THERE IS NO CURRENT SURVEY FOR THIS PROJECT. LINES AND POINTS SHOWN ARE APPROXIMATE AND BASED ON GIS DATA, AERIAL IMAGERY, AND STREETVIEW, THERE MAY BE EXISTING FEATURES NOT DISPLAYED OR CONFLICTS THAT HAVE NOT BEEN IDENTIFIED.
2. FILL LINES AND DRIVEWAY TIE-INS ARE NOT SHOWN DUE TO THE LACK OF SIGNIFICANT CONTOUR DATA.
3. RELOCATE ALL SIGNS SO THEY REMAIN IN THE FURNISHING ZONE.

PRELIMINARY DESIGN REVIEW

PROJECT NAME: East Columbia Avenue from Harvey st. to Paige st.
PROJECT NO: xxx-xxx
DATE: June 3, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts	Sanitary Sewer Conflicts	Water Valve/Hydro Conflicts
Option 1	22'-36'	North	22'-36'	Post Curb	5'	2'	0'	8	1	

Sidewalk Length = 2780'

Option 1 (Planning Option)

- Follows Planning option: 5' sidewalk, 2' Furnishing Zone, Post Curb. North side of the road
- The fill behind the sidewalk pushes back to take up most of the residential yards
- Requires 1 ROW takes
- Relocate 5 mailboxes
- Reset existing fence on 6 tracts
- Relocate 3 signs
- Existing gas line runs under entire project area
- Relocate 2 light poles, and 5 utility poles
- Trees to be removed 8 tracts

Local Roads Sidewalk Estimate (\$/lf)	Percent/Length	Cost/lf
Sidewalks - Local Roadways	100%	\$459.75
Drainage	80%	\$225
Contingency 15%	15%	
Engineering/CEI 25%	25%	
RoW - Residential Roadways 10%	10%	\$1
Easement - Local Roads	70%	\$14
Damages - Local Roads	25%	\$3
Appraisal/closing	100%	\$13
Project length		2780
Estimated Cost:		\$2,823,000

Beaumont Avenue Sidewalk Improvements

PRELIMINARY DESIGN REVIEW

PROJECT NAME: Beaumont Avenue from McSpadden Street to W Baxter Avenue
PROJECT NO: 43803
DATE: June 10, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts	Sanitary Sewer Conflicts
Option 1	22'-25'	North	22'-25'	Prop C&G	5'	2'	0'	2	0

Sidewalk Length = 945'

Option 1 (Planning Option)

- Follows Planning option: 5' sidewalk, 2' grass buffer, curb and gutter
- Requires 2 ROW takes
- Relocate 5 signs street signs, 1 commercial sign
- Existing gas line runs under 500 feet of project area
- 3 trees to be removed
- Closing Sidebrook Ave and Alley entrances, decreasing commercial driveways for access control

Local Roads Sidewalk Estimate (\$/lf)	Percent/Length	Cost/lf
Sidewalks - Local Roadways	100%	\$315.50
Drainage	90%	\$258
Contingency 15%	15%	
Engineering/CEI 25%	25%	
RoW - Residential Roadways 15%	15%	\$1
RoW - Commercial Local Roadways 0%	0%	\$0
Easement - Local Roads	100%	\$20
Damages - Local Roads	50%	\$5
Appraisal/closing	100%	\$13
	Project length	945
	Estimated Cost:	\$817,000
	Cost/lf:	\$865
	Sidewalks - Local Roadways	\$298,144.95
	Drainage	\$243,810
	Sub-Total Construction Costs:	\$542,000
	Contingency 15%	\$82,000
	Total Construction Costs:	\$624,000
	Engineering/CEI 25%	\$156,000
	RoW - Residential Roadways 15%	\$945
	RoW - Commercial Local Roadways 0%	\$0
	Easement - Local Roads	\$18,900
	Damages - Local Roads	\$4,725
	Appraisal/closing	\$12,285
	RoW & Easement Acquisition/Damages/Appraisals	\$37,000

PRELIMINARY DESIGN REVIEW OPTIONS

PROJECT NAME: West Martin Mill Pike from Chapman Highway to South of Druid Dr (existing sidewalk)
PROJECT NO: 43803.00
DATE: July 27, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts	Water Meter, Valve, and Hydrant Conflicts
Option 1	29'-36'	West	28'-31'	Prop C&G	5'	0'	none	1	2
Sidewalk Length = 367 LF									

Option 1

- Install 5' sidewalk and C&G along the west side of the roadway
- Layout was not based on survey, so the number of conflicts and the design is subject to change. Cut/fill and driveway tie-in lengths are an approximation
- Install crosswalk and stop bar along Chapman Highway; install yield sign for right turn lane; install pedestrian push buttons at curb ramps along Chapman Highway
- Potential water meter, sanitary cleanout, water service line, and sanitary service line adjustments on each property
- Adjust 1 water valve and 1 fire hydrant
- Adjust 2 gas valves
- Relocate 1 utility pole
- Replace 1 drainage casting
- Relocate 1 mailbox
- Replace curbs on 3521 Martin Mill Pike
- Relocate bollards and wooden posts at 3419 Chapman Highway
- Remove or reset approximately 149 LF of fencing
- Potential tree and brush impacts along 3437 Martin Mill Pike

Nadine Street Safety Improvements

PRELIMINARY DESIGN REVIEW OPTIONS

PROJECT NAME: Nadine Street from Coker Ave to Cecil Ave
PROJECT NO: 43803.00
DATE: July 27, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts	Water Meter, Valve, and Hydrant Conflicts
Option 1	23'-26'	West	25'-28'	Prop C&G	5'	2'	none	6+	9

Sidewalk Length = 1,373 LF

Option 1

- Install 5' sidewalk, 2' Furnishing Zone, and C&G along the southwest side of the roadway
- Layout was not based on survey, so the number of conflicts and the design is subject to change. Cut/fill and driveway tie-in lengths are an approximation
- Relocate driveway of 1722 Coker Ave uphill, commercial driveway slope must be met
- Retaining wall will be required at various spots along Nadine Street
- Install crosswalk across Nadine Street at Fine Ave intersection and potentially create a 3-way stop condition
- Potential water meter, sanitary cleanout, water service line, and sanitary service line adjustments on each property
- Relocate 5 water meters and 1 fire hydrant; adjust 3 water valves
- Relocate 1 and adjust 1 gas valves
- There are at least 10 utility poles which might be able to fit within the furnishing zone, if design cannot be achieved some many need to be relocated
- Relocate at least 4 utility poles and 2 guy wires
- Relocate 4 signs
- Relocate 1 mailbox
- Full closed drainage system will be required. Add culvert extensions to existing culverts and remove some existing driveway culverts
- Tree, brush, and vegetation impacts along project

Local Roads Sidewalk Estimate (\$/lf)	Percent/Length	Cost/lf
Sidewalks - Local Roadways	100%	\$335
Drainage	100%	\$287
Retaining Wall 10%	10%	\$79

Henegar Street Sidewalk Improvements

PRELIMINARY DESIGN REVIEW OPTIONS

PROJECT NAME: Henegar Street from Ledgerwood Ave to Atlantic Ave
PROJECT NO: 43803.00
DATE: June 9, 2020

OPTIONS	Existing Pavement Width (EOP to EOP)	Proposed Side of Road	Proposed Pavement Width (EOP to EOP)	Proposed Curb and Gutter/ Post Curb	Proposed Sidewalk Width	Proposed Grass Strip Width	Proposed Bicycle Zone	Power Pole Conflicts
Option 1	16'-28'	South	15.5'-27'	Prop C&G	5'	0'-2'	none	10
Sidewalk Length = 1,737 LF								

Option 1

- Install 5' sidewalk, 2' furnishing zone, and C&G along the east side of the roadway
- The west side was investigated, but it was determined the east side was more feasible due to utility impacts, spacing, constructability, and pedestrian safety
- Layout was not based on survey, so the number of conflicts and the design is subject to change. Cut/fill and driveway tie-in lengths are an approximation
- From Ledgerwood Ave to Oglewood Ave sidewalk may not be feasible. Roadway width is only 16' and there is not much offset off of the roadway
- Potential water meter, sanitary cleanout, water service line, and sanitary service line adjustments on each property
- Relocate 10 utility poles
- Proposed drainage design most likely necessary to deal with roadway spreads
- Replace 4 drainage castings, replace 1 structure, and work proposed drainage systems into existing infrastructure
- Adjust 2 and relocate 2 miscellaneous utility boxes
- Remove or reset approximately 970 LF of residential fencing
- Potential tree and brush impacts along length of the project

- NOTES:**
1. THERE IS NO CURRENT SURVEY FOR THIS PROJECT. LINES AND POINTS SHOWN ARE APPROXIMATE AND BASED ON GIS DATA, AERIAL IMAGERY, AND STREETVIEW. THERE MAY BE EXISTING FEATURES NOT DISPLAYED OR CONFLICTS THAT HAVE NOT BEEN IDENTIFIED.
 2. CUT/FILL LINES AND DRIVEWAY TIE-INS ARE APPROXIMATE AND MAY REQUIRE MORE SPACE THAN SHOWN.
 3. RELOCATE ALL SIGNS SO THEY REMAIN IN THE FURNISHING ZONE.
