2018
Knoxville Residential Code
Significant Changes (proposed)

December 20, 2018

By James Tente, MCP, CBO, CFM
jtente@knoxvilleetn.gov
The goal of these presentations is to identify and discuss the building code changes and the impacts on our stakeholders.

The position of the building department has been to adopt the codes with the fewest amendments.
Appendices—Adopted

• A- Sizing of Gas Piping
• B- Sizing of Venting Systems
• C- Exit Terminals of Direct Vent/Mech-Draft
• D- Recommended Safety Inspection/Existing Appliances
• E. Manufactured Housing Used as Dwellings
• F. Radon Control Methods
• G- Piping Standards
• H- Patio Covers
• I- Private Sewage Disposal
• J- Existing Buildings and Structures
• K- Sound Transmission
• L- Permit Fees.
• M- Home Daycare in R-3
• N- Venting Methods
• O- Auto Vehicle Gates
• P- Sizing of Water Piping
• Q- Tiny Houses
• R- Light Straw-Clay Construction
• S- Straw bale Construction
• T- Solar Ready Homes
Permit Expiration

- Permits are valid for 365 days from the date of issuance.
- Permits can be renewed.
Foundation Inspections—Required.
A structure not greater than 3,000 sq.ft. in floor area, and not more than two stories in height, the use of which that is customarily accessory to and incidental to that of the dwelling(s) and which that is located on the same lot.

(2015) Height increased to 3 stories maximum.

IRC height and areas are SEPARATE from ZONING Regulations.
A change in the use of a building or portion of a building that involves a change in the application of the requirements of this code.

A definition for “Change of Occupancy” has been added and the requirement for a certificate of occupancy when there is a change of occupancy or use has been clarified.
**R202-Crawl Spaces**

- An underfloor space that is not a basement.
- No previous definition existed.
R301.2.1.1.1-Sunrooms(2015)

- Sunrooms shall comply with AAMA/NPEA/NSA 2100.
- Five different categories:
R301.2.1.1.1-Sunrooms (2015)—Cat I

- **Category I**
  - A thermally isolated sunroom with walls that are open or enclosed with insect screening or 0.5mm plastic film. The space is non-habitable and unconditioned.
  - Defined for purpose of energy (N1102.2) requirements.
R301.2.1.1.1-Sunrooms(2015)—Cat II

- Thermally isolated sunroom with enclosed walls.
- The openings are enclosed with translucent or transparent plastic or glass.
- The space is non-habitable and unconditioned.
• Thermally isolated sunroom with enclosed walls.
• The openings are enclosed with translucent or transparent plastic or glass.
• The sunroom fenestration complies with additional requirements for air infiltration resistance and water infiltration resistance.
• The space is non-habitable and unconditioned.
• **Category IV**
  - Thermally isolated sunroom with enclosed walls. The sunroom is designed to be heated or cooled by a separate temperature control or system and is thermally isolated from the primary structure.
  - The sunroom fenestration complies with the additional requirements for water penetration resistance, air infiltration resistance and thermal performance.
  - The space is non-habitable and conditioned.
R301.2.1.1.1-Sunrooms(2015)--Cat V

- A sunroom with enclosed walls.
- The sunroom is designed to be heated or cooled and is open to the main structure.
- The sunroom fenestration complies with the additional requirements for water penetration resistance, air infiltration resistance and thermal performance.
- The space is habitable and conditioned.

R302-Fire Resistant Construction

- All references moved to R302 for simplicity:
  - Exterior Walls
  - Townhouse Separation
  - Two-family Separation
  - Penetrations
  - Garage to Dwelling
  - Under Stairs
  - Foam Plastics
  - Interior Finishes
  - Fireblocking
  - Draftstopping
  - Insulation
Each townhouse shall be structurally independent.

Exceptions:
- Foundations
- Roof and Wall Sheathing
- Non-structural Wall Coverings
- Flashing
- Townhouses separated by a common wall
R302.1(1) Fire Resistance Table Changed

- Footnote added to the table: 1 Hour-tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code with exposure from both sides.

UL 263

Fire Tests of Building Construction and Materials

- Fire-rating certifications based upon test method and acceptance criteria.
- Ratings are expressed in minutes or hours
  - 20/45/60/90/120/180 minutes
- Applicable to
  - Floor-ceilings
  - Roof-ceilings
  - Beams
  - Columns
  - Walls and partitions
R302.1(1) Fire Resistance Table Changed (2015)

- Foot note b, 0 hours required for eave where no gable vent not allowed, 0 hours required.
- Fire resistance requirements where less than <2 FSD now included for clarity.

**Table R302.1(1) Exterior Walls**

<table>
<thead>
<tr>

</tbody>
</table>

For SI: 1 foot = 304.8 mm.
N/A = Not Applicable.

<sup>a</sup> Roof eave fire-resistance rating shall be permitted to be reduced to 0 hours on the underside of the eave if fireblocking is provided from the wall top plate to the underside of the roof sheathing.

<sup>b</sup> Roof eave fire-resistance rating shall be permitted to be reduced to 0 hours on the underside of the eave provided that gable vent openings are not installed.
Foot note a, fire blocking reduces projection to 0 hours required.

</tbody>
</table>

For SI: 1 foot = 304.8 mm.
NA = Not Applicable.

<sup>a</sup> The fire-resistance rating shall be permitted to be reduced to 0 hours on the underside of the eave overhang if fireblocking is provided from the wall top plate to the underside of the roof sheathing.

<sup>b</sup> The fire-resistance rating shall be permitted to be reduced to 0 hours on the underside of the rake overhang where gable vent openings are not installed.
R302.2.4.2 Membrane Penetrations

- New Exception #4:
  - Ceiling membrane penetrations by listed luminaires or by luminaires protected with listed materials that have been tested for use in fire resistance rated assemblies and are installed in accordance with the instructions included with the listing.
Exception 2:

Floor assemblies located directly over a crawl space not intended for storage or fuel fired equipment or electric powered heating appliances.
R302.5 Opening Protection

- Self closing or automatic closing doors opening from a garage to the residence required.
  - Previously amended out of the code.
• The walkline across winder treads and landings shall be concentric to the turn and parallel to the direction of travel entering and exiting a turn.
• The walkline shall be located 12 inches from the inside of the turn.
• The 12 inch dimension shall be measured from the widest clear stair width at the walking surface.
• Minimum tread depth of 9”-10” measured between the vertical planes of the foremost projections at intersection of walkline.
• Winder treads shall have a 4”-6” min at any point.
Previously amended to Maximum 8” rise and 9” tread depth.
R311.7.11 Alternating Tread Devices

- New exception:
  - Alternating tread devices are allowed to be used as an element of a means of egress for lofts, mezzanines and similar areas of 200 gross square feet or less where such devices DO NOT provide exclusive access to a kitchen or bathroom.
New Exception:

Ship ladders are allowed to be used as an element of a means of egress for lofts, mezzanines and similar areas of 200 gross square feet or less that do not provide exclusive access to kitchen or bathrooms.
30” amendment deleted.

All stairs with 4 or more risers shall have a graspable handrail.
R313 Automatic Sprinkler Systems

- Not required.
R314.4 Smoke Alarm Interconnection

• Exception Removed:
  • Interconnection of smoke alarms in existing areas shall not be required where alterations or repairs do not result in removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or basement available that could provide access for interconnection without removal of interior finishes.
  • The exemption for interconnection of alarms during alterations based on feasibility has been removed from the code.
R312.2 Window Fall Protection

- **R312.2.1 Window Sills**
  - In dwelling units, where the top of the sill of an operable window opening is located less than 24 inches above the finished floor and greater than 72 inches above the finished grade or other surface below on the exterior of the building the operable window shall comply with ONE of the following:
    - Operable window openings will not allow a 4 inch sphere to pass through where the openings are at their largest opened position.
    - Operable windows are provided with window fall protection devices that comply with ASTM F2090.
    - Operable windows are provided with window opening control devices that comply with R312.2.2.
R312.2 Window Fall Protection

- R312.2.1 Window Sills
  - In dwelling units, where the top of the sill of an operable window opening is located less than 24 inches above the finished floor and greater than 72 inches above the finished grade or other surface below on the exterior of the building the operable window shall comply with ONE of the following:
    - Operable window openings will not allow a 4 inch sphere to pass through where the openings are at their largest opened position.
    - Operable windows are provided with window fall protection devices that comply with ASTM F2090.
    - Operable windows are provided with window opening control devices that comply with R312.2.2.
R315.5 CO Alarm Interconnection

- When more than one required they shall be interconnected.
- Interconnection can be through listed wireless devices.
- Exception:
  - Interconnection of smoke alarms in existing areas shall not be required where alterations or repairs do not result in removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or basement available that could provide access for interconnection without removal of interior finishes.
• R324.2 Solar Thermal Systems
• R324.3 Photovoltaic Systems
• R324.4 Roof Top Systems
• R324.5 Building Integrated
• R324.6 Roof Access
• R324.7 Ground Mounted Systems

Requirements for roof access and pathways for firefighters have been introduced into the IRC provisions for rooftop mounted photovoltaic solar energy systems.

• Rooftop mounted photovoltaic solar energy panels and modules are not permitted to be installed below emergency escape and rescue openings.
R325.6 Habitable Attics

- Shall not be considered a Story where:
  1. Occupiable floor area is not less than 70sq.ft.
  2. Occupiable floor area has R305 ceiling heights.
  3. Occupiable area is enclosed by roof assembly above, knee walls on the sides and floor/ceiling assembly below.
R408.3 Unvented Crawlspace

Provisions for elimination of ventilation openings where:

Dehumidification:

• System sized to provide 70 pints of moisture removal per day for every 1,000 sq. ft. of crawl space floor area.

• Ventilation of the under-floor space is not required when an adequately sized dehumidifier is provided.
R507 Decks

Significant re-organization and addition to provide more direction for deck design and construction.
R806.5 Unvented Attics

- Unvented attics and unvented enclosed roof framing assemblies created by ceilings that are applied directly to the underside of the roof framing members and structural roof sheathing applied directly to the top of the roof framing members/rafters, shall be permitted where all the following conditions are met:
  
- 1. The unvented attic space is completely within the building thermal envelope.
- 2. No interior Class I vapor retarders are installed on the ceiling side (attic floor) of the unvented attic assembly or on the ceiling side of the unvented enclosed roof framing assembly.
- 3. Where wood shingles or shakes are used, a minimum 1/4-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.
- 5. Insulation shall be located in accordance with the following: 5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met...
Vented vs Unvented Attics--Concept

Vented Attic in Winter
- Heat escapes through thin insulation on HVAC equipment;
- Conditioned air escapes through duct leak.
- Warm surface remains above dewpoint.
- Air leak (remains in conditioned space).
- Warm, moist air and humidity cannot enter closed-cell foam, which is an air barrier/vapor retarder.

Unvented Attic in Winter
- A small amount of heat escapes through insulation.
- Warm, conditioned interior space.

Vented Attic in Summer
- Warm exterior air enters at soffit vents and exits at ridge.
- Radiant heat hits thin insulation on HVAC equipment; some of it gets through and mixes with conditioned air.
- Conditioned interior space.
- Sunlight hits roof and becomes conducted and radiant heat.
- Closed-cell foam.

Unvented Attic in Summer
- Only a small amount of heat gets through insulation.
- Air leak (remains in conditioned space).
- A portion of radiant heat that hits insulation passes through to interior.
- Conditioned interior space.

</tbody>
</table>

For SI: 1 foot = 304.8 mm.

- **a.** R-values are minimums. U-factors and SHGC are maximums. When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the installed R-value of the insulation shall not be less than the R-value specified in the table.
- **b.** The fenestration U-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
- **c.** Skylights may be excluded from glazed fenestration SHGC requirements in Climate Zones 1 through 3 where the SHGC for such skylights does not exceed 0.30.
- **d.** "5/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulation on the interior or exterior of the home. "10/13" means R-10 continuous insulation on the interior of the home or R-13 cavity insulation at the interior of the basement wall.
- **e.** R-5 shall be added to the required slab edge R-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Zones 1 through 3 for heated slabs.
- **f.** There are no SHGC requirements in the Marine Zone.
- **g.** Basement wall insulation is not required in warm-humid locations as defined by Figure N1101.10 and Table N1101.10.
- **h.** Or insulation sufficient to fill the framing cavity, R-19 minimum.
- **i.** The first value is cavity insulation, the second value is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 continuous insulation.
- **j.** The second R-value applies when more than half the insulation is on the interior of the mass wall.
Non-Energy Trusses... R-49 Required

Typical Attic Insulation with "Regular Heel"

- Baffle
- Minimum 1" space between insulation and roof sheathing
- Insulatable depth at rafter heel
- R-30 = 10"
- R-38 = 12"
- R-49 = 15"
N1102.2.1 (R402.2.1) Ceilings with attic spaces.

Where Section R1102.1.2 requires R-38 insulation in the ceiling, installing R-30 insulation over 100 percent of the ceiling area requiring insulation shall satisfy the requirement for R-38 insulation wherever the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves. Where Section N1102.1.2 requires R-49 insulation in the ceiling, installing R-38 insulation over 100 percent of the ceiling area requiring insulation shall satisfy the requirement for R-49 insulation wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the $U$-factor alternative approach in Section N1102.1.4 and the Total UA alternative in Section N1102.1.5.
The IECC provides four different compliance options for residential buildings. The most easy-to-use option is the prescriptive insulation and fenestration compliance path provided in Section R402. The assemblies in this publication are deemed to be equivalent to the frame wall assemblies of the prescriptive insulation requirements specified in Table R402.1.1 of the 2009 and 2012, and Table R402.1.2 of the 2015 IECC for those climate zones that require R20 or R13+5 insulation. A two-dimensional assembly U-factor calculation using the parallel path method as outlined in ASHRAE Handbook – Fundamentals (Chapter 27) was used to determine the assemblies that are equivalent to the R20 benchmark wall assemblies based on the insulation requirements of IECC. This methodology utilizes the U-factors shown in Table 4 of ESR-2586,¹ issued in accordance with the acceptable criteria for determining wood-frame wall assemblies as noted in ICC-ES Environmental Criteria EC115² and Section R102 of the IECC,³ to show equivalency to the 2009 and 2012 IECC. To show equivalency to the 2015 IECC, this methodology utilizes Table R402.1.4 in the 2015 code. (Note for energy raters: During the 2015 IECC code development process, all frame wall U-factors in Table R402.1.3 of the 2012 IECC were revised. The equivalent U-factor for R20 or R13+5 wall assemblies is 0.060 in the 2015 code.)

R20 WALL ASSEMBLY A
LOW-DENSITY FIBERGLASS INSULATION / ADVANCED FRAMING TECHNIQUES

In order to offset the performance of lower-cost R19 compressed fiberglass batts (equivalent to R18) as cavity insulation, this 2x6 wall assembly incorporates advanced framing techniques. The assembly includes conventional headers and double top plates. The framing factor is assumed to be no greater than 20 percent.

R20 WALL ASSEMBLY B
LOW-DENSITY FIBERGLASS INSULATION / INSULATED HEADERS

This assembly uses insulated headers and advanced framing techniques to increase thermal values. It uses R19 compressed fiberglass batts (equivalent to R18) as cavity insulation. The assembly includes double top plates. The framing factor is assumed to be no greater than 22 percent.

2x6 with R19 Batt Insulation, Insulated Headers, Advanced Framing

a. 22% framing factor is calculated using studs at 24' o.c. (framing factor = 22%), or studs at 16' o.c. (framing factor = 25%) with a combination of insulated corners, insulated interior-exterior wall intersections and limited cripple supports at door and window openings (4% maximum reduction in framing percentage, 3% assumed). See page 7 for additional information. This assembly is subject to verification and approval by the local authority having jurisdiction.
b. R9.6 represents a triple-ply wood header consisting of 4.5' of wood and 1' of minimum R4/inch insulation. Any header that exceeds this R-value (e.g., an R13.8 double-ply header, as shown in Table 2) can be used.
R20 WALL ASSEMBLY C
LOW-DENSITY FIBERGLASS INSULATION / INSULATED SIDING

This assembly uses only conventional framing techniques with 2x6 studs and increases thermal values with insulated siding (a minimum insulation value of R2). The assembly includes conventional headers, double top plates and permits the use of R19 compressed fiberglass batts (equivalent to R18) as cavity insulation. The framing factor is assumed to be no greater than 25 percent.*

BETTER THAN R20 WALL ASSEMBLY D
AGGRESSIVE ADVANCED FRAMING AND INSULATION LEVELS

This assembly combines several enhancements to achieve a lower U-factor or higher R-value. It features 2x6 framing and a framing factor of no greater than 18 percent through the use of advanced framing techniques. The assembly includes R21 cavity insulation, insulated headers and double top plates. This assembly exemplifies how the performance of a typical 2x6 wall can be improved with the addition of aggressive advanced framing techniques.a

a. 18% framing factor is calculated using studs at 24" o.c. (framing factor = 22%) with a combination of insulated corners, insulated interior-exterior wall intersections and limited cripple supports at door and window openings (4% reduction in framing percentage). See page 7 for additional information. This assembly is subject to verification and approval by the local authority having jurisdiction.

b. R13.8 represents a double-ply header consisting of 3" of wood and 2-1/2" of minimum R4/linch insulation, as shown in Table 2.
R20 WALL ASSEMBLY E

2x4 WALL

This assembly combines 2x4 framing with some advanced framing techniques. It includes insulated siding, insulated headers, R15 cavity insulation and double top plates. The framing factor is assumed to be no greater than 22 percent.a

*a. Nonfenestration U-factors shall be obtained from measurement, calculation or an approved source.*

*b. Mass walls shall be in accordance with Section N1102.2.5. Where more than half the insulation is on the interior, the mass wall U-factors shall not exceed 0.17 in Climate Zone 1, 0.14 in Climate Zone 2, 0.12 in Climate Zone 3, 0.087 in Climate Zone 4 except Marine, 0.065 in Climate Zone 5 and Marine 4, and 0.057 in Climate Zones 6 through 8.*

*c. In warm-humid locations as defined by Figure N1101.7 and Table N1101.7, the basement wall U-factor shall not exceed 0.360.*
N1102.1.5 (R402.1.5) Total UA alternative.

Where the total building thermal envelope UA, the sum of U-factor times assembly area, is less than or equal to the Total UA resulting from multiplying the U-factors in Table N1102.1.4 by the same assembly area as in the proposed building, the building shall be considered to be in compliance with Table N1102.1.2. The UA calculation shall be performed using a method consistent with the ASHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. In addition to UA compliance, SHGC requirements shall be met.

REScheck

Residential Compliance Using REScheck™

The REScheck product group makes it fast and easy for builders, designers, and contractors to determine whether new homes, additions, and alterations meet the requirements of the IECC or a number of state energy codes. REScheck also simplifies compliance determinations for building officials, plan checkers, and inspectors by allowing them to quickly determine if a low-rise residence meets the code.

REScheck is appropriate for insulation and window trade-off calculations in residential detached one- and two-family buildings and multi-family buildings three stories or less in height above grade, such as apartments, condominiums, and townhouses. REScheck works by performing a simple U-factor x Area (UA) calculation for each building assembly to determine the overall UA of a building. The UA that would result from a building conforming to the code requirements is compared against the UA for your building. If the total heat loss (represented as a UA) through the envelope of your building does not exceed the total heat loss from the same building conforming to the code, the software generates a report that declares your building is compliant with the code.

REScheck Desktop may be downloaded and installed directly to your desktop, while REScheck-Web™ is accessible directly from the website without having to download and install.
Simulated Energy Performance

SECTION N1105 (R405)
SIMULATED PERFORMANCE ALTERNATIVE (PERFORMANCE)

N1105.1 (R405.1) Scope.
This section establishes criteria for compliance using simulated energy performance analysis. Such analysis shall include heating, cooling, mechanical ventilation and service water heating energy only.

N1105.2 (R405.2) Mandatory requirements.
Compliance with this section requires that the mandatory provisions identified in Section N1101.13 be met. Supply and return ducts not completely inside the building thermal envelope shall be insulated to an R-value of not less than R-6.

N1105.3 (R405.3) Performance-based compliance.
Compliance based on simulated energy performance requires that a proposed residence (proposed design) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the standard reference design. Energy prices shall be taken from a source approved by the building official, such as the Department of Energy, Energy Information Administration’s State Energy Data System Prices and Expenditures reports. Building officials shall be permitted to require time-of-use pricing in energy cost calculations.

Exception: The energy use based on source energy expressed in Btu (J) or Btu per square foot (J/m²) of conditioned floor area shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.

N1105.4 (R405.4) Documentation.
Documentation of the software used for the performance design and the parameters for the building shall be in accordance with Sections N1105.4.1 through N1105.4.3.

N1105.4.1 (R405.4.1) Compliance software tools.
Documentation verifying that the methods and accuracy of the compliance software tools conform to the provisions of this section shall be provided to the building official.

N1105.4.2 (R405.4.2) Compliance report.
Compliance software tools shall generate a report that documents that the proposed design complies with Section N1105.3. A compliance report on the proposed design shall be submitted with the application for the building permit. Upon completion of the building, a compliance report based on the as-built condition of the building shall be submitted to the building official before a certificate of occupancy is issued. Batch sampling of buildings to determine energy code compliance shall only be allowed for stacked multiple-family units.

Compliance reports shall include information in accordance with Sections N1105.4.2.1 and N1105.4.2.2. Where the proposed design of a building could be built on different sites where the cardinal orientation of the building on each site is different, compliance of the proposed design for the purposes of the application for the building permit shall be based on the worst-case orientation, worst-case configuration, worst-case building air leakage and worst-case duct leakage. Such worst-case parameters shall be used as inputs to the compliance software for energy analysis.
N1106.4 (R406.4) ERI-based compliance.

Compliance based on an ERI analysis requires that the rated design be shown to have an ERI less than or equal to the appropriate value indicated in Table N1106.4 when compared to the ERI reference design.

* Where on-site renewable energy is included for compliance using the ERI analysis of Section N1106.4, the building shall meet the mandatory requirements of Section N1106.2, and the building thermal envelope shall be greater than or equal to the levels of efficiency and SHGC in Table N1102.1.2 or Table N1102.1.4.
The prescriptive U-factors for fenestration have been lowered to improve the energy efficiency of dwellings and townhouses.

N1103.2.2 Ducts Sealing

- Ducts must be sealed.
- Rough in test required (if ducts are not located in the conditioned space)
  - 4 cfm/100sf Floor area w/air handler
  - 3 cfm/100sf Floor area w/0 air handler
N1103.3.5 Building Cavities

- Building framing cavities are prohibited as air ducts or plenum.
Previously deleted from the 2012 code by amendment is now mandatory.

Ducts inside conditioned spaces shall not be required to be tested.

New provisions address the methods, minimum coverage requirements and thermal benefits for ducts buried within ceiling insulation, and when those ducts are considered inside the building thermal envelope.
N1102.4.2 Fireplace Doors

- New wood burning fireplaces shall have tight fitting flue dampers or doors, and outdoor combustion air.
- Where tight fitting doors on factory built fireplaces are installed, such doors shall be listed and labeled to UL 127.
Air Barrier & Insulation

- Supply and Return Register Boots must be sealed to the subfloor or drywall.
- Recessed lighting must be sealed to the finished surface.
- Spaces behind electrical/data boxes need to be insulated.
Air Leakage Testing, previously deleted from the 2012 code is now mandatory.
- Maximum 3 ACH 50 leakage rate.

N1104.1 Lighting Efficiency

- 75% high efficacy lamps increased to 90%.
N1103.6 Mechanical Ventilation Required

- All buildings shall have mechanical ventilation in accordance with M1505.

M1505.4.1 System design.
The whole-house ventilation system shall consist of one or more supply or exhaust fans, or a combination of such, and associated ducts and controls. Local exhaust or supply fans are permitted to serve as such a system. Outdoor air ducts connected to the return side of an air handler shall be considered as providing supply ventilation.

M1505.4.2 System controls.
The whole-house mechanical ventilation system shall be provided with controls that enable manual override.

M1505.4.3 Mechanical ventilation rate.
The whole house mechanical ventilation system shall provide outdoor air at a continuous rate as determined in accordance with Table M1505.4.3(1) or Equation 15-1.

Ventilation rate in cubic feet per minute = \((0.01 \times \text{total square foot area of house}) + [7.5 \times (\text{number of bedrooms} + 1)]\)

\[(\text{Equation 15-1})\]

Exception: The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1) is multiplied by the factor determined in accordance with Table M1505.4.3(2).

For SI: 1 square foot = 0.0929 m², 1 cubic foot per minute = 0.0004719 m³/s.
Amendment to not require the radon vent to extend through the roof is deleted.

Delete the text of Section AFT03.5.3 Vent pipe in its entirety and substitute the following: A plumbing tee or other approved connection shall be inserted horizontally beneath the sheathing and connected to a 3- or 4-inch-diameter (76 or 102 mm) fitting with a vertical vent pipe installed through the sheathing. The vent pipe shall be extended up through the building floors, and terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the conditioned spaces of the building that is less than 2 feet (610 mm) below the exhaust point, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings.

Exception: The vent pipe shall be allowed to terminate in the attic and may be capped unless tests verify the radon potential to be 4 pCi/L or greater.
• Pool barrier requirements previously found in Appendix G which were previously excluded by ordinance.
• In addition to any other pool related safety requirements.
• Design criteria for pool structures.
Significant Changes

The End. Thank You.

By James Tente, MCP
jtente@knoxvillem.gov
